11C90 650 MHz Prescalers

Literature Number: SNOS374A

11C90/11C91 650 MHz Prescalers

General Description

The 11C90 and 11C91 are high-speed prescalers designed specifically for communication and instrumentation applications. All discussions and examples in this data sheet are applicable to the 11C91 as well as the 11C90.

The 11C90 will divide by 10 or 11 and the 11C91 by 5 or 6, both over a frequency range from DC to typically 650 MHz. The division ratio is controlled by the Mode Control. The divide-by-10 or -11 capability allows the use of pulse swallowing techniques to control high-speed counting modulos by lower-speed circuits. The 11C90 may be used with either ECL or TTL power supplies.

In addition to the ECL outputs Q and \overline{Q} , the 11C90 contains an ECL-to-TTL converter and a TTL output. The TTL output operates from the same V_{CC} and V_{EE} levels as the counter, but a separate pin is used for the TTL circuit V_{EE}. This minimizes noise coupling when the TTL output switches and

also allows power consumption to be reduced by leaving the separate $V_{\mbox{\scriptsize EE}}$ pin open if the TTL output is not used.

Not Intended For New Designs

To facilitate capacitive coupling of the clock signal, a 400 Ω resistor (V_{REF}) is connected internally to the V_{BB} reference. Connecting this resistor to the Clock Pulse input (CP) automatically centers the input about the switching threshold. Maximum frequency operation is achieved with a 50% duty cycle.

Each of the Mode Control inputs is connected to an internal 2 k Ω resistor with the other end uncommitted (RM₁ and RM₂). An M input can be driven from a TTL circuit operating from the same V_{CC} by connecting the free end of the associated 2 k Ω resistor to V_{CCA}. When an M input is driven from the ECL circuit, the 2 k Ω resistor can be left open or, if required, can be connected to V_{EE} to act as a pull-down resistor.

Note 1: Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.

Note 2: The specified limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

Note 3: Typical limits are at V_{CC} = 5.0V and T_{A} = $\,+\,25^{\circ}C.$

Note 4: The M_1 and M_2 threshold specifications are normally referenced to the V_{CC} potential, as shown in the ECL operation tables. Using V_{EE} (GND) as the reference, as in normal TTL practice, effectively makes the threshold vary directly with V_{CC} . Threshold is typically 1.3V below V_{CC} (e.g., +3.7V at V_{CC} = +5V). A signal swing about threshold of ±0.4V is adequate, which gives the state V_{H1} and V_{L1} values. The internal 2 k Ω resistors are intended to pull TTL outputs up to the required V_{H1} range, as discussed in the Functional Description and shown in *Figure 5*.

Note 5: TTL Output Signal swing is guaranteed at f_{MAX} over temperature range.

Note 6: M_1 or M_2 can be tied to V_{CC} for fixed divide-by-ten operation.

Functional Description

The 11C90 contains four ECL Flip-Flops, an ECL to TTL converter and a Schottky TTL output buffer with an active pull-up. Three of the Flip-Flops operate as a synchronous shift counter driving the fourth Flip-Flop operating as an asynchronous toggle. The internal feedback logic is such that the TTL output and the Q ECL output are HIGH for six clock periods and LOW for five clock periods. The Mode Control (M) inputs can modify the feedback to make the output HIGH for five clock periods and LOW for five clock periods, as indicated in the Count Sequence Table.

The feedback logic is such that the instant the output goes HIGH, the circuit is already committed as to whether the output period will be 10 or 11 clock periods long. This means that subsequent changes in an M input signal, including decoding spikes, will have no effect on the current output period. The only timing restriction for an M input signal is that it be in the desired state at least a setup time before the clock that follows the HHLL state shown in the table. The allowable propagation delay through external logic to an M input is maximized by designing it to use the positive transition of the 11C90 output as its active edge. This gives an allowable delay of ten clock periods, minus the CP to Q delay of the 11C90 and the M to CP setup time. If the external logic uses the negative output transition as its active edge, the allowable delay is reduced to five clock periods minus the previously mentioned delay and setup time.

Capacitively coupled triggering is simplified by the 400 $\!\Omega$ resistor which connects pin 15 to the internal V_{BB} reference. By connecting this to the CP input, as shown in Figure 3, the clock is automatically centered about the input threshold. A clock duty cycle of 50% provides the fastest operation, since the Flip-Flops are Master-Slave types with offset clock thresholds between master and slave. This feature ensures that the circuit will operate with clock waveforms having very slow rise and fall times, and thus, there is no maximum frequency restriction. Recommended minimum and maximum clock amplitude as a function of a frequency and temperature are shown in the graph labeled Figure 2. When the CP or any other input is driven from another ECL circuit, normal ECL termination methods are recommended. One method is indicated in Figure 4. Other ECL termination methods are discussed in the F100K ECL Design Guide (Section 5 of Databook).

When an M input is to be driven from a TTL output operating from the same V_{CC} and ground (V_{EE}), the internal 2 k $_{\Omega}$ resistor can be used to pull the TTL output up as shown in *Figure 5*. Some types of TTL outputs will only pull up to within two diode drops of V_{CC}, which is not high enough for 11C90 inputs. The resistor will pull the signal up through the threshold region, although this final rise may be somewhat slow, depending on wiring capacitance. A resistor network that gives faster rise and also lower impedance is shown in *Figure 6*.

Functional Description (Continued)

The ECL outputs have no pull-down resistors and can drive series or parallel terminated transmission lines. For short interconnections that do not require impedance matching, a 270 Ω to 510 Ω resistor to V_{EE} can be used to establish the V_{OL} level. Both V_{CC} pins must always be used and should

be connected together as close to the package as possible. Pin 12 must always be connected to the V_{EE} side of the supply, while pin 13 is required only if the TTL output is used. Low impedance V_{CC} and V_{EE} distribution and RF bypass capacitors are recommended to prevent crosstalk.

Logic Diagram 11C90

Note: This diagram is provided for understanding of logic operation only. It should not be used for evaluation of propagation delays as many internal functions are achieved more efficiently than shown.

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
