

### ADVANCE SPECIFICATION

#### DESCRIPTION

The 2526 is a high speed 5,184-bit Static Read-Only Memory available in a 64x9x9 organization. This device has TTL compatible inputs and outputs and requires +5V and -12V power supplies. A READ input controls the entry of data from the ROM into output latches. Three-state outputs allow OR tying for implementing larger memories. OUTPUT ENABLE controls the nine output devices without affecting address circuitry.

#### FEATURES

- 64x9x9 ORGANIZATION
- 625ns TYPICAL ACCESS TIME
- STATIC OPERATION
- OUTPUT LATCHES
- TTL/DTL COMPATIBLE INPUTS
- TTL/DTL COMPATIBLE THREE-STATE OUTPUTS
- $V_{CC} = +5V$ ,  $V_{GG} = -12V$
- 24-PIN SILICONE DIP
- SIGNETICS P-MOS SILICON GATE PROCESS TECHNOLOGY

#### APPLICATIONS

VERTICAL OR RASTER SCAN DISPLAYS (7x9 MATRIX)  
PRINTER CHARACTER GENERATOR  
PANEL DISPLAYS AND BILLBOARDS  
MICRO-PROGRAMMING  
CODE CONVERSION

#### BIPOLAR COMPATIBILITY

All inputs of the 2526 can be driven directly by standard bipolar integrated circuits (TTL, DTL, etc.). The data output buffers are capable of sinking a minimum of 1.6mA sufficient to drive one standard TTL load.

#### STANDARD TRUTH TABLES

The 2526N/CM3940 is a 7x9 matrix, ASCII character set (raster scan)\*utilizing the two unused left-most columns for BCDIC-ASCII and BAUDOT-ASCII code converters. Use this device for evaluation or for suitable application. Other standards will be announced as they become available.

\*for vertical scan specify CM3400

#### CUSTOM TRUTH TABLES

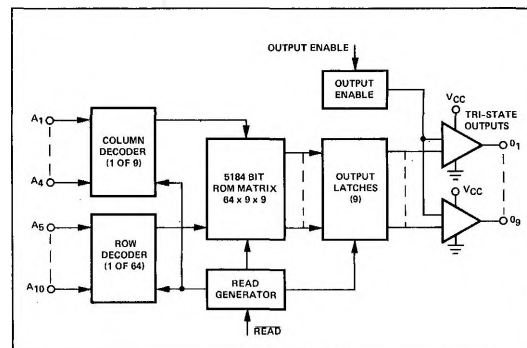

See page 7-197.

## NOTES:

- Stresses above those listed under "Maximum Guaranteed Rating" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
- For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 110°C/W junction to ambient.
- All inputs are protected against static charge.
- Parameters are valid over operating temperature range unless specified.
- All voltage measurements are referenced to ground.
- Manufacturer reserves the right to make design and process changes and improvements.
- Typical values are at +25°C and nominal supply voltages.
- Outputs Open, t<sub>RPW</sub> = 250ns, t<sub>RPW</sub> = 500ns.
- T<sub>A</sub> = 0°C to +70°C
- During t<sub>RPW</sub><sup>1</sup> data is clocked into the output latches and the address decoders are precharged in preparation for the next cycle.
- During t<sub>RPW</sub><sup>1</sup> addresses are decoded and sent to the memory matrix; and the stored memory data is moved to the data inputs of the output RS latches. This data is clocked into the output latches at the end (rising edge) of the READ pulse. After t<sub>A2</sub>, data appears at the output terminals.
- Addresses must be stable within 50ns after the READ line falls and must remain stable until at least 50ns before the READ line goes high.

## TIMING DIAGRAM

Note: All times measured from 50% points, for all input waveforms  $t_r = t_f < 10\text{nsec}$ .

## NOTES

1. BCDIC to ASCII in leftmost column, Baudot to ASCII in next column to right.
2. Undefined addresses result in all outputs going low (TTL "0").
3. Blank squares in character font are high (TTL "1").
