

INTRODUCTION

LINEAR INTEGRATED CIRCUITS

[illegible]

The 5070, 5071, and 5072 are monolithic silicon integrated circuits that constitute a complete chroma system for color television receivers. The 5070 is a complete subcarrier regeneration system featuring a new concept of phase control applied to the oscillator circuit. The 5071 is a chroma amplifier system and the 5072 performs the demodulation function.

The 5070 utilizes the 16-lead plastic dual-in-line package; the 5071 and 5072 are supplied 14-lead plastic dual-in-line packages.
