

54AC/74AC258 • 54ACT/74ACT258 Quad 2-Input Multiplexer with TRI-STATE® Outputs

General Description

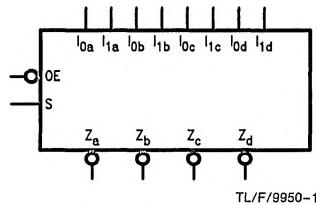

The 'AC/ACT258 is a quad 2-input multiplexer with TRI-STATE outputs. Four bits of data from two sources can be selected using a common data select input. The four outputs present the selected data in the complement (inverted) form. The outputs may be switched to a high impedance state with a HIGH on the common Output Enable (OE) input, allowing the outputs to interface directly with bus-oriented systems.

Features

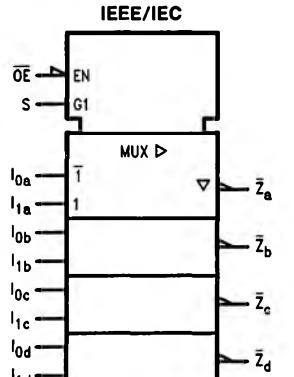

- Multiplexer expansion by tying outputs together
- Inverting TRI-STATE outputs
- Outputs source/sink 24 mA
- 'ACT258 has TTL-compatible inputs
- Standard Military Drawing (SMD)
 - 'ACT258: 5962-88704

Functional Description

The 'AC/'ACT258 is a quad 2-input multiplexer with TRI-STATE outputs. It selects four bits of data from two sources under control of a common Select input (S). When the Select input is LOW, the I_{0x} inputs are selected and when Select is HIGH, the I_{1x} inputs are selected. The data on the selected inputs appears at the outputs in inverted form. The 'AC/'ACT258 is the logic implementation of a 4-pole, 2-position switch where the position of the switch is determined by the logic levels supplied to the Select input. The logic equations for the outputs are shown below:

$$\begin{aligned}Z_a &= \overline{OE} \cdot (I_{1a} \cdot S + I_{0a} \cdot \overline{S}) \\Z_b &= \overline{OE} \cdot (I_{1b} \cdot S + I_{0b} \cdot \overline{S}) \\Z_c &= \overline{OE} \cdot (I_{1c} \cdot S + I_{0c} \cdot \overline{S}) \\Z_d &= \overline{OE} \cdot (I_{1d} \cdot S + I_{0d} \cdot \overline{S})\end{aligned}$$

When the Output Enable input (\overline{OE}) is HIGH, the outputs are forced to a high impedance state. If the outputs of the TRI-STATE devices are tied together, all but one device must be in the high impedance state to avoid high currents that would exceed the maximum ratings. Designers should

ensure that Output Enable signals to TRI-STATE devices whose outputs are tied together are designed so there is no overlap.

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. National does not recommend operation of FACT™ circuits outside databook specifications.
