Functional Description

The 'FCT563A contains eight D-type latches with TRI-STATE complementary outputs. When the Latch Enable (LE) input is HIGH, data on the D_n inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW the latches store the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The TRI-STATE buffers are controlled by the Output Enable (\bar{OE}) input. When OE is LOW, the buffers are in the TRI-STATE mode. When \bar{OE} is HIGH the buffers are in the high impedance mode but that does not interfere with entering new data into the latches.

Function Table

\bar{OE}	LE	D	O	
H	X	X	Z	High-Z
