MONOSTABLE MULTIVIBRATOR

**CONNECTION DIAGRAM
PINOUT A**

DESCRIPTION — The '121 features positive and negative dc level triggering inputs and complementary outputs. Input pin 5 directly activates a Schmitt circuit which provides temperature compensated level detection, increases immunity to positive-going noise and assures jitter-free response to slowly rising triggers.

When triggering occurs, internal feedback latches the circuit, prevents re-triggering while the output pulse is in progress and increases immunity to negative-going noise. Noise immunity is typically 1.2 V at the inputs and 1.5 V on Vcc.

Output pulse width stability is primarily a function of the external Rx and Cx chosen for the application. A 2 kΩ internal resistor is provided for optional use where output pulse width stability requirements are less stringent. Maximum duty cycle capability ranges from 67% with a 2 kΩ resistor to 90% with a 40 kΩ resistor. Duty cycles beyond this range tend to reduce the output pulse width. Otherwise, output pulse width follows the relationship:

$$t_w = 0.69 \text{ RxCx}$$

NOTE:

Triggering occurs only when the \bar{Q} output is HIGH (not in timing cycle) and one of the above triggering situations is satisfied.

H = HIGH Voltage Level

L = LOW Voltage Level

X = Immaterial
