## 5-BIT SHIFT REGISTER

**DESCRIPTION** — The '96 consists of five RS master/slave flip-flops connected to perform parallel-to-serial or serial-to-parallel conversion of binary data. Since both inputs and outputs to all flip-flops are accessible, parallel-in/parallel-out or serial-in/serial-out operation may be performed.

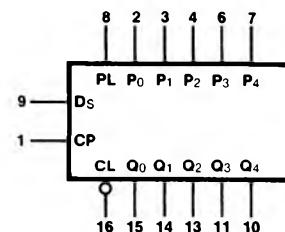

All flip-flops are simultaneously set to the LOW state by applying a low level voltage to the clear input. This condition may be applied independent of the state of the clock input.

The flip-flops may be independently set to the HIGH state by applying a high level voltage to both the preset input of the specific flip-flop and the common parallel load input. The parallel enable input is provided to allow setting each flip-flop independently or setting two or more flip-flops simultaneously. Preset is independent of the state of the clock input or clear input.

Transfer of information to the output pins occurs when the clock input goes from a LOW level to a HIGH level. Since the flip-flops are RS master/slave circuits, the proper information must appear at the RS inputs of each flip-flop prior to the rising edge of the clock input voltage waveform. The serial input provides this information to the first flip-flop, while the outputs of the subsequent flip-flops provide information for the remaining RS inputs. The clear input must be at a HIGH level and the parallel load input must be at a LOW level for serial shifting.

<b>PIN NAMES</b>	<b>DESCRIPTION</b>	<b>54/74 (U.L.) HIGH/LOW</b>
CP	Clock Pulse Input (Active Rising Edge)	1.0/1.0
CL	Asynchronous Clear Input (Active LOW)	1.0/1.0
D <sub>s</sub>	Serial Data Input	1.0/1.0
P <sub>0</sub> — P <sub>4</sub>	Parallel Data Inputs	1.0/1.0
PL	Asynchronous Parallel Load Input (Active HIGH)	5.0/5.0
Q <sub>0</sub> — Q <sub>4</sub>	Parallel Outputs	10/10

## MODE SELECT TABLE

INPUTS						OPERATION*
PL	P <sub>n</sub>	CL	D <sub>s</sub>	C <sub>P</sub>	Q <sub>n</sub>	
L	X	L	X	X	L	Clear; all outputs forced LOW
H	H**	H	X	X	H	Selectively Preset; each output set to its P input
H	L**	H	X	X	L	
L	X	H	H, L	/	Q <sub>n - 1</sub>	Shift right; D <sub>s</sub> → Q <sub>0</sub> ; Q <sub>0</sub> → Q <sub>1</sub> , etc.

\*Simultaneous Preset and Clear operations produce undefined states.

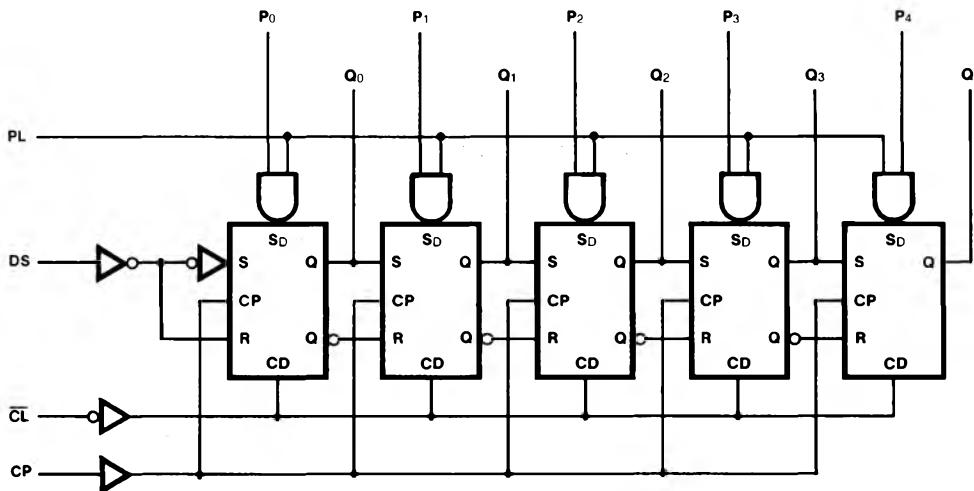

\*\*To insure proper presetting, P inputs must remain stable while PL is LOW.

H = HIGH Voltage Level

L = LOW Voltage Level

X = Immaterial
