## GENERAL DESCRIPTION

The Am27S21 (256 words by 4-bits) is a Schottky TTL Programmable Read-Only Memory (PROM).

This device is only available in a three-state (Am27S21) output version. These outputs are compatible with low-

power Schottky bus standards capable of satisfying the requirements of a variety of microprogrammable controls, mapping functions, code version, or logic replacement. Easy word-depth expansion is facilitated by active LOW ( $G_1$  and  $G_2$ ) output enables.

## PIN DESCRIPTION

### $A_0 - A_7$ Address Inputs (Inputs)

The 8-bit field presented at the address inputs selects one of 256 memory locations to be read from.

### $Q_0 - Q_3$ Data Output Port (Outputs)

The output whose state represents the data read from the selected memory locations.

### $G_1, G_2$ Output Enable

Provides direct control of the Q output buffers. Outputs disabled force all open-collector outputs to an OFF state

and all three-state outputs to a floating or high-impedance state.

$$\text{Enable} = \overline{G_1} \cdot \overline{G_2}$$

$$\begin{aligned}\text{Disable} &= \overline{G_1} \cdot G_2 \\ &= G_1 + G_2\end{aligned}$$

### V<sub>CC</sub> Device Power Supply Pin

The most positive of the logic power supply pins.

### GND Device Power Supply Pin

The most negative of the logic power supply pins.

## FUNCTIONAL DESCRIPTION

### Applying The Am27S21

Typical application of the Am27S21 is shown below. The Am27S21 is employed as mapping ROMs in a microprogram computer control unit. The eight-bit macroinstruction from main memory is brought into the  $A_0 - A_7$  inputs of the mapping ROM array. The instruction is mapped into a 12-bit address

space with each PROM output supplying 4 bits. The 12 bits of address are then supplied to the "D" inputs of the Am2910 as a possible next address source for microprogram memory. The MAP output of the Am2910 is connected to the  $\overline{G_1}$  input of the Am27S21 such that when the  $\overline{G_1}$  input is HIGH, the outputs of the PROMs are in the three-state mode in the case of the Am27S21. The  $G_2$  input is grounded; thus data from other sources are free to drive the D inputs of the Am2910 when MAP is HIGH.
