- Low-current PNP inputs
- · High-current open-collector and three-state outputs
- fuses
- High programming yield
- Fast chip select
- GENERAL DESCRIPTION

The Am27S21 (256 words by 4-bits) is a Schottky TTL Programmable Read-Only Memory (PROM).

This device is only available in a three-state (Am27S21) output version. These outputs are compatible with low-

power Schottky bus standards capable of satisfying the requirements of a variety of microprogrammable controls, mapping functions, code version, or logic replacement. Easy word-depth expansion is facilitated by active LOW ( $\overline{G}_1$  and  $\overline{G}_2$ ) output enables.

Am27S21/27S21A

# PIN DESCRIPTION

#### A<sub>0</sub> – A<sub>7</sub> Address Inputs (Inputs) The 8-bit field presented at the address inputs selects one

of 256 memory locations to be read from.

# Q0-Q3 Data Output Port (Outputs)

The output whose state represents the data read from the selected memory locations.

G1, G2 Output Enable

Provides direct control of the Q output buffers. Outputs disabled force all open-collector outputs to an OFF state

# FUNCTIONAL DESCRIPTION

#### Applying The Am27S21

Typical application of the Am27S21 is shown below. The Am27S21 is employed as mapping ROMs in a microprogram computer control unit. The eight-bit macroinstruction from main memory is brought into the  $A_0 - A_7$  inputs of the mapping ROM array. The instruction is mapped into a 12-bit address

and all three-state outputs to a floating or high-impedance state.

Enable =  $\overline{G_1 \cdot G_2}$ Disable =  $\overline{G_1 \cdot G_2}$ =  $G_1 + G_2$ 

V<sub>CC</sub> Device Power Supply Pin The most positive of the logic power supply pins.

GND Device Power Supply Pln The most negative of the logic power supply pins.

space with each PROM output supplying 4 bits. The 12 bits of address are then supplied to the "D" inputs of the Am2910 as a possible next address source for microprogram memory. The MAP output of the Am2910 is connected to the  $\overline{G_1}$  input of the Am27S21 such that when the  $\overline{G_1}$  input is HIGH, the outputs of the PROMs are in the three-state mode in the case of the Am27S21. The  $\overline{G_2}$  input is grounded; thus data from other sources are free to drive the D inputs of the Am2910 when MAP is HIGH.

# ABSOLUTE MAXIMUM RATINGS

.

•

.

Storage Temperature65 to +	150°C
Ambient Temperature with	
Power Applied55 to +	125°C
Supply Voltage0.5 V to +	7.0 V
DC Voltage Applied to Outputs	
(Except During Programming)0.5 V to +VCC	Max.
DC Voltage Applied to Outputs	
During Programming	21 V
Output Current into Outputs During	
Programming (Max. Duration of 1 sec)	0 mA
DC Input Voltage0.5 V to +	5.5 V
DC input Current30 mA to +	5 mA
Stresses above those listed under ABSOLUTE MAX	IMUM

RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

# OPERATING RANGES

Commercial (C) Devices Ambient Temperature (T <sub>A</sub> )0 to +75°C Supply Voltage (V <sub>CC</sub> )+4.75 V to +5.25 V	
Military (M) Devices* Case Temperature (T <sub>C</sub> )	

Operating ranges define those limits between which the functionality of the device is guaranteed.

\*Military product 100% tested at  $T_C$  +25°C, +125°C, and -55°C.

COUT	Output Capacitance	VIN/VOUT = 2.0 V. @ 1 = 1 MHz (Note 4)			8		pF

DC CHARACTERISTICS over operating ranges unless otherwise specified (for APL Products, Group A, Subgroups 1, 2, 3 are tested unless otherwise noted)

.

Notes: 1. This applies to three-state devices only.
 2. V<sub>IL</sub> and V<sub>IH</sub> are input conditions of output tests and are not themselves directly tested. V<sub>IL</sub> and V<sub>IH</sub> are absolute voltages with respect to device ground and include all overshoots due to system and/or tester noise. Do not attempt to test these values without suitable equipment.
 3. Not more than one output should be shorted at a time. Duration of the short circuit should not be more than one second.
 4. These parameters are not 100% tested, but are evaluated at initial characterization and at any time the design is modified where capacitance may be affected.

See also Switching Test Circuits.

,

.

Notes: 1. Tests are performed with input transition time of 5 ns or less, timing reference levels of 1.5 V, and input pulse levels of 0 to 3.0 V using test load in A under Switching Test Circuita.
 2. TGVOZ is measured at steady state HIGH output voltage = 0.5 V and steady state LOW output voltage + 0.5 V output levels using the test load in B under Switching Test Circuita.

"Subgroups 7 and 8 apply to functional tests.

# SWITCHING TEST CIRCUITS

A. Output Load for all tests except TGVQZ

•

2. S1 is open for Output Data HIGH to Hi-Z and Hi-Z to Output Data HIGH tests. S1 is closed for all other AC tests.

3. Load capacitance includes all stray and fixture capacitance.

Notes: 1. All device test loads should be located within 2" of device output pin.
