1 Overview

The AMD Athlon™ XP processor model 8 with QuantiSpeed™ architecture powers the next generation in computing platforms, delivering extreme performance for Windows® XP.

The AMD Athlon™ XP processor model 8, based on leading-edge 0.13 micron technology, integrates the innovative design and manufacturing expertise of AMD to deliver improved performance, lower power, and smaller die size while maintaining the stable and compatible Socket A infrastructure of the AMD Athlon processor.

Delivered in an OPGA package, the AMD Athlon XP processor model 8 delivers the integer, floating-point, and 3D multimedia performance for highly demanding applications running on x86 system platforms. The AMD Athlon XP processor model 8 delivers compelling performance for cutting-edge software applications that include high-speed Internet capability, digital content creation, digital photo editing, digital video, image compression, video encoding for streaming over the Internet, soft DVD, commercial 3D modeling, workstation-class computer-aided design (CAD), commercial desktop publishing, and speech recognition. The AMD Athlon XP processor model 8 also offers the scalability and reliability that IT managers and business users require for enterprise computing.

The AMD Athlon XP processor model 8 features a seventh-generation microarchitecture with an integrated, exclusive L2 cache, which supports the growing processor and system bandwidth requirements of emerging software, graphics, I/O, and memory technologies. The high-speed execution core of the AMD Athlon XP processor model 8 includes multiple x86 instruction decoders, a dual-ported 128-Kbyte split level-one (L1) cache, an exclusive 256-Kbyte L2 cache, three independent integer pipelines, three address calculation pipelines, and a superscalar, fully pipelined, out-of-order, three-way floating-point engine. The floating-point engine is capable of delivering outstanding performance on numerically complex applications.

The features of the AMD Athlon XP processor model 8 are QuantiSpeed™ architecture, a high-performance full-speed cache, an advanced 333 front-side Bus (FSB) with a 2.7-Gigabyte per second system bus, or an advanced 266 FSB with a 2.1-Gigabyte per second system bus, and 3DNow!™ Professional technology. The AMD Athlon system bus combines the latest technological advances, such as point-to-point topology, source-synchronous packet-based transfers, and low-voltage signaling to provide an extremely powerful, scalable bus for an x86 processor.

The AMD Athlon XP processor model 8 is binary-compatible with existing x86 software and backwards compatible with applications optimized for MMX™, SSE, and 3DNow! technology. Using a data format and single-instruction multiple-data (SIMD) operations based on the MMX instruction model, the AMD Athlon XP processor model 8 can produce as many as four, 32-bit, single-precision floating-point results per clock cycle. The 3DNow! Professional technology implemented in the AMD Athlon XP processor model 8 includes new integer multimedia instructions and software-directed data movement instructions for optimizing such applications as digital content creation and streaming video for the internet, as well as new instructions for digital signal processing (DSP) and communications applications.

1.1 QuantiSpeed™ Architecture Summary

The following features summarize the AMD Athlon XP processor model 8 QuantiSpeed architecture:

- Advanced 333 FSB technology available
- An advanced nine-issue, superpipelined, superscalar x86 processor microarchitecture designed for increased instructions per cycle (IPC) and high clock frequencies
- Fully pipelined floating-point unit that executes all x87 (floating-point), MMX, SSE and 3DNow! instructions
- Hardware data pre-fetch that increases and optimizes performance on high-end software applications utilizing high-bandwidth system capabilities
- Advanced two-level translation look-aside buffer (TLB) structures for both enhanced data and instruction address translation. The AMD Athlon XP processor model 8 with QuantiSpeed architecture incorporates three TLB optimizations: the L1 DTLB increases from 32 to 40 entries, the L2 ITLB and L2 DTLB both use exclusive architecture, and the TLB entries can be speculatively loaded.

The AMD Athlon XP processor model 8 delivers excellent system performance in a cost-effective, industry-standard form factor. The AMD Athlon XP processor model 8 is compatible with motherboards based on Socket A.

2 Interface Signals

This section describes the interface signals utilized by the AMD Athlon™ XP processor model 8.

2.1 Overview

The AMD Athlon™ system bus architecture is designed to deliver excellent data movement bandwidth for next-generation x86 platforms as well as the high-performance required by enterprise-class application software. The system bus architecture consists of three high-speed channels (a unidirectional processor request channel, a unidirectional probe channel, and a 64-bit bidirectional data channel), source-synchronous clocking, and a packet-based protocol. In addition, the system bus supports several control, clock, and legacy signals. The interface signals use an impedance controlled push-pull, low-voltage, swing-signaling technology contained within the Socket A socket.

For more information, see "AMD Athlon™ System Bus Signals" on page 6, Chapter 11, "Pin Descriptions" on page 55, and the *AMD Athlon™ System Bus Specification*, order# 21902.

2.2 Signaling Technology

The AMD Athlon system bus uses a low-voltage, swing-signaling technology, that has been enhanced to provide larger noise margins, reduced ringing, and variable voltage levels. The signals are push-pull and impedance compensated. The signal inputs use differential receivers that require a reference voltage (V_{REF}). The reference signal is used by the receivers to determine if a signal is asserted or deasserted by the source. Termination resistors are not needed because the driver is impedance-matched to the motherboard and a high impedance reflection is used at the receiver to bring the signal past the input threshold.

For more information about pins and signals, see Chapter 11, "Pin Descriptions" on page 55.

2.3 Push-Pull (PP) Drivers

The AMD Athlon XP processor model 8 supports push-pull (PP) drivers. The system logic configures the processor with the configuration parameter called SysPushPull (1=PP). The impedance of the PP drivers is set to match the impedance of the motherboard by two external resistors connected to the ZN and ZP pins.

See "ZN and ZP Pins" on page 80 for more information.

2.4 AMD Athlon™ System Bus Signals

The AMD Athlon system bus is a clock-forwarded, point-to-point interface with the following three point-to-point channels:

- A 13-bit unidirectional output address/command channel
- A 13-bit unidirectional input address/command channel
- A 72-bit bidirectional data channel

For more information, see Chapter 8, "Electrical Data" on page 31 and the *AMD Athlon™ System Bus Specification*, order# 21902.

3 Logic Symbol Diagram

Figure 2 is the logic symbol diagram of the processor. This diagram shows the logical grouping of the input and output signals.

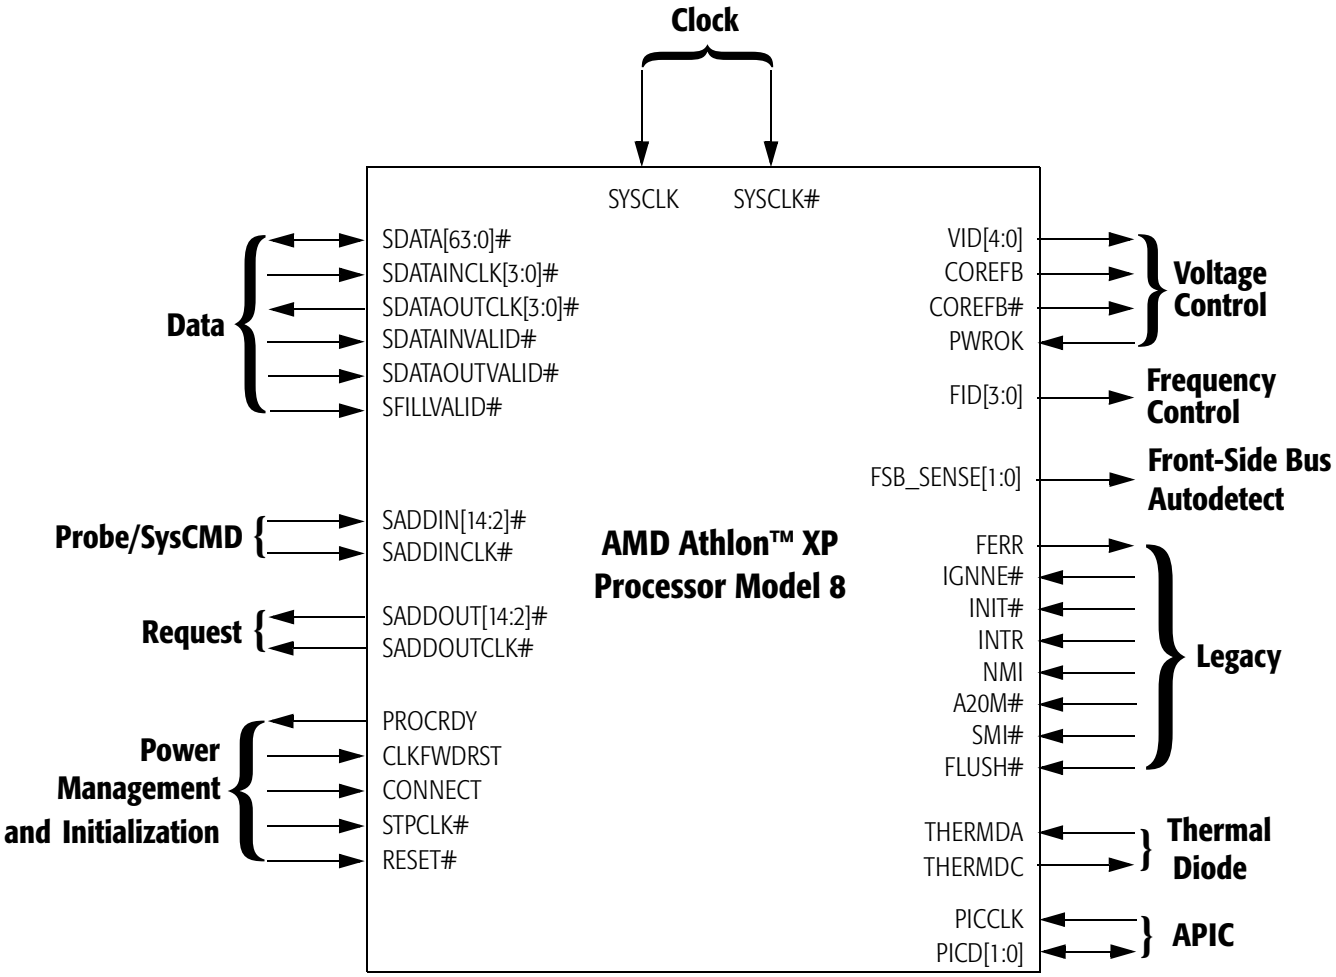

Figure 2. Logic Symbol Diagram

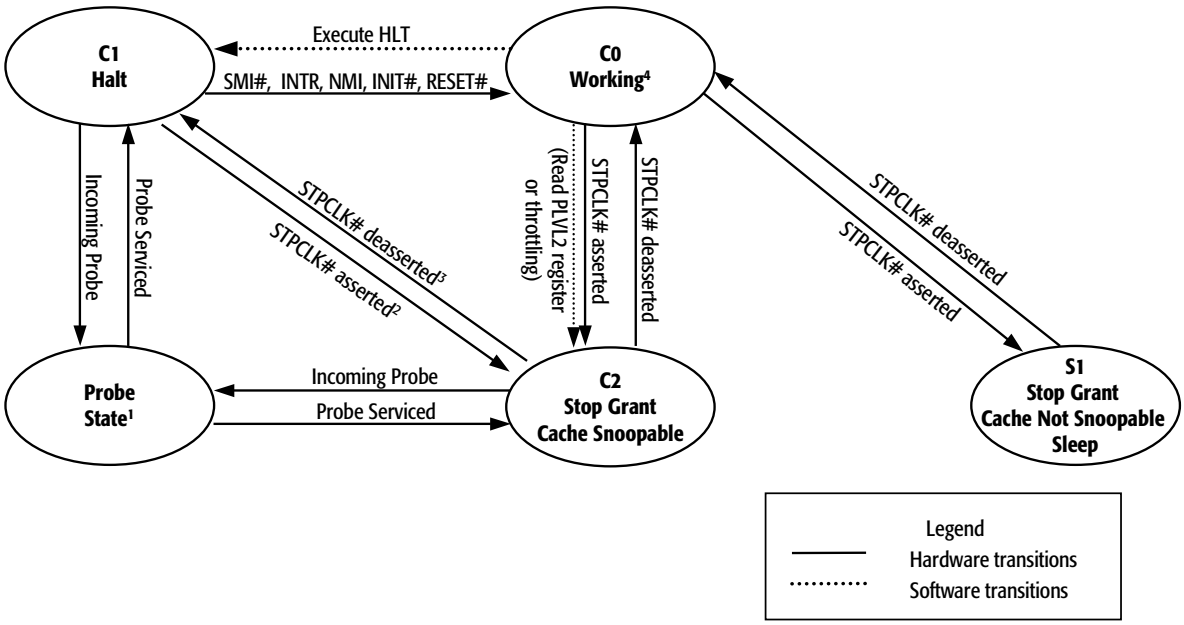
4 Power Management

This chapter describes the power management control system of the AMD Athlon™ XP processor model 8. The power management features of the processor are compliant with the ACPI 1.0b and ACPI 2.0 specifications.

4.1 Power Management States

The AMD Athlon XP processor model 8 supports low-power Halt and Stop Grant states. These states are used by advanced configuration and power interface (ACPI) enabled operating systems for processor power management.

Figure 3 shows the power management states of the processor. The figure includes the ACPI "Cx" naming convention for these states.



Note: The AMD Athlon™ System Bus is connected during the following states:
1) The Probe state
2) During transitions between the Halt state and the C2 Stop Grant state
3) During transitions between the C2 Stop Grant state and the Halt state
4) C0 Working state

Figure 3. AMD Athlon™ XP Processor Model 8 Power Management States

The following sections provide an overview of the power management states. For more details, refer to the *AMD Athlon™ System Bus Specification*, order# 21902.

Note: *In all power management states that the processor is powered, the system must not stop the system clock (SYSCLK/SYSCLK#) to the processor.*

Working State

The Working state is the state in which the processor is executing instructions.

Halt State

When the processor executes the HLT instruction, the processor enters the Halt state and issues a Halt special cycle to the AMD Athlon system bus. The processor only enters the low power state dictated by the CLK_Ctl MSR if the system controller (Northbridge) disconnects the AMD Athlon system bus in response to the Halt special cycle.

If STPCLK# is asserted, the processor will exit the Halt state and enter the Stop Grant state. The processor will initiate a system bus connect, if it is disconnected, then issue a Stop Grant special cycle. When STPCLK# is deasserted, the processor will exit the Stop Grant state and re-enter the Halt state. The processor will issue a Halt special cycle when re-entering the Halt state.

The Halt state is exited when the processor detects the assertion of INIT#, RESET#, SMI#, or an interrupt via the INTR or NMI pins, or via a local APIC interrupt message. When the Halt state is exited, the processor will initiate an AMD Athlon system bus connect if it is disconnected.

Stop Grant States

The processor enters the Stop Grant state upon recognition of assertion of STPCLK# input. After entering the Stop Grant state, the processor issues a Stop Grant special bus cycle on the AMD Athlon system bus. The processor is not in a low-power state at this time, because the AMD Athlon system bus is still connected. After the Northbridge disconnects the AMD Athlon system bus in response to the Stop Grant special bus cycle, the processor enters a low-power state dictated by the CLK_Ctl MSR. If the Northbridge needs to probe the processor during the Stop Grant state while the system bus is disconnected, it must first connect the system bus. Connecting the system bus

places the processor into the higher power probe state. After the Northbridge has completed all probes of the processor, the Northbridge must disconnect the AMD Athlon system bus again so that the processor can return to the low-power state. During the Stop Grant states, the processor latches INIT#, INTR, NMI, SMI#, or a local APIC interrupt message, if they are asserted.

The Stop Grant state is exited upon the deassertion of STPCLK# or the assertion of RESET#. When STPCLK# is deasserted, the processor initiates a connect of the AMD Athlon system bus if it is disconnected. After the processor enters the Working state, any pending interrupts are recognized and serviced and the processor resumes execution at the instruction boundary where STPCLK# was initially recognized. If RESET# is sampled asserted during the Stop Grant state, the processor exits the Stop Grant state and the reset process begins.

There are two mechanisms for asserting STPCLK#—hardware and software.

The Southbridge can force STPCLK# assertion for throttling to protect the processor from exceeding its maximum case temperature. This is accomplished by asserting the THERM# input to the Southbridge. Throttling asserts STPCLK# for a percentage of a predefined throttling period: STPCLK# is repetitively asserted and deasserted until THERM# is deasserted.

Software can force the processor into the Stop Grant state by accessing ACPI-defined registers typically located in the Southbridge.

The operating system places the processor into the C2 Stop Grant state by reading the P_LVL2 register in the Southbridge.

If an ACPI Thermal Zone is defined for the processor, the operating system can initiate throttling with STPCLK# using the ACPI defined P_CNT register in the Southbridge. The Northbridge connects the AMD Athlon system bus, and the processor enters the Probe state to service cache snoops during Stop Grant for C2 or throttling.

In C2, probes are allowed, as shown in Figure 3 on page 9

The Stop Grant state is also entered for the S1, Powered On Suspend, system sleep state based on a write to the SLP_TYP and SLP_EN fields in the ACPI-defined Power Management 1 control register in the Southbridge. During the S1 Sleep state, system software ensures no bus master or probe activity occurs. The Southbridge deasserts STPCLK# and brings the processor out of the S1 Stop Grant state when any enabled resume event occurs.

Probe State

The Probe state is entered when the Northbridge connects the AMD Athlon system bus to probe the processor (for example, to snoop the processor caches) when the processor is in the Halt or Stop Grant state. When in the Probe state, the processor responds to a probe cycle in the same manner as when it is in the Working state. When the probe has been serviced, the processor returns to the same state as when it entered the Probe state (Halt or Stop Grant state). When probe activity is completed the processor only returns to a low-power state after the Northbridge disconnects the AMD Athlon system bus again.

4.2 Connect and Disconnect Protocol

Significant power savings of the processor only occur if the processor is disconnected from the system bus by the Northbridge while in the Halt or Stop Grant state. The Northbridge can optionally initiate a bus disconnect upon the receipt of a Halt or Stop Grant special cycle. The option of disconnecting is controlled by an enable bit in the Northbridge. If the Northbridge requires the processor to service a probe after the system bus has been disconnected, it must first initiate a system bus connect.

Connect Protocol

In addition to the legacy STPCLK# signal and the Halt and Stop Grant special cycles, the AMD Athlon system bus connect protocol includes the CONNECT, PROCRDY, and CLKFWDRST signals and a Connect special cycle.

AMD Athlon system bus disconnects are initiated by the Northbridge in response to the receipt of a Halt or Stop Grant. Reconnect is initiated by the processor in response to an interrupt for Halt or STPCLK# deassertion. Reconnect is initiated by the Northbridge to probe the processor.

The Northbridge contains BIOS programmable registers to enable the system bus disconnect in response to Halt and Stop Grant special cycles. When the Northbridge receives the Halt or Stop Grant special cycle from the processor and, if there are no outstanding probes or data movements, the Northbridge deasserts CONNECT a minimum of eight SYSCLK periods after the last command sent to the processor. The processor detects the deassertion of CONNECT on a rising edge of SYSCLK and deasserts PROCRDY to the Northbridge. In return, the Northbridge asserts CLKFWDRST in anticipation of reestablishing a connection at some later point.

Note: *The Northbridge must disconnect the processor from the AMD Athlon system bus before issuing the Stop Grant special cycle to the PCI bus or passing the Stop Grant special cycle to the Southbridge for systems that connect to the Southbridge with HyperTransport™ technology.*

This note applies to current chipset implementation—alternate chipset implementations that do not require this are possible.

Note: *In response to Halt special cycles, the Northbridge passes the Halt special cycle to the PCI bus or Southbridge immediately.*

The processor can receive an interrupt after it sends a Halt special cycle, or STPCLK# deassertion after it sends a Stop Grant special cycle to the Northbridge but before the disconnect actually occurs. In this case, the processor sends the Connect special cycle to the Northbridge, rather than continuing with the disconnect sequence. In response to the Connect special cycle, the Northbridge cancels the disconnect request.

The system is required to assert the CONNECT signal before returning the C-bit for the connect special cycle (assuming CONNECT has been deasserted).

For more information, see the *AMD Athlon™ System Bus Specification*, order# 21902 for the definition of the C-bit and the Connect special cycle.

Figure 4 shows STPCLK# assertion resulting in the processor in the Stop Grant state and the AMD Athlon system bus disconnected.

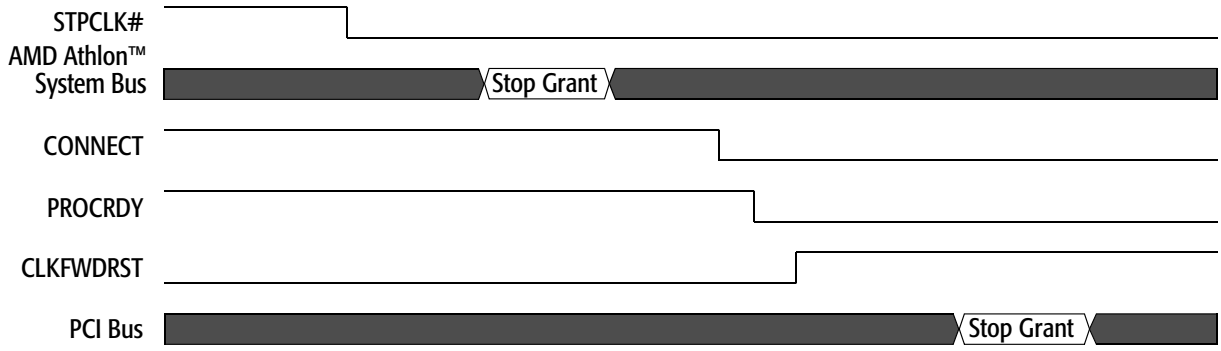


Figure 4. AMD Athlon™ System Bus Disconnect Sequence in the Stop Grant State

An example of the AMD Athlon system bus disconnect sequence is as follows:

1. The peripheral controller (Southbridge) asserts STPCLK# to place the processor in the Stop Grant state.
2. When the processor recognizes STPCLK# asserted, it enters the Stop Grant state and then issues a Stop Grant special cycle.
3. When the special cycle is received by the Northbridge, it deasserts CONNECT, assuming no probes are pending, initiating a bus disconnect to the processor.
4. The processor responds to the Northbridge by deasserting PROCRDY.
5. The Northbridge asserts CLKFWDRST to complete the bus disconnect sequence.
6. After the processor is disconnected from the bus, the processor enters a low-power state. The Northbridge passes the Stop Grant special cycle along to the Southbridge.

Figure 5 shows the signal sequence of events that takes the processor out of the Stop Grant state, connects the processor to the AMD Athlon system bus, and puts the processor into the Working state.

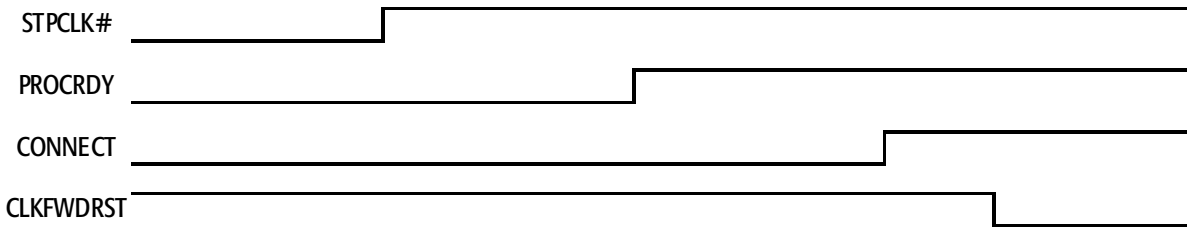

Figure 5. Exiting the Stop Grant State and Bus Connect Sequence

The following sequence of events removes the processor from the Stop Grant state and connects it to the system bus:

1. The Southbridge deasserts STPCLK#, informing the processor of a wake event.
2. When the processor recognizes STPCLK# deassertion, it exits the low-power state and asserts PROCRDY, notifying the Northbridge to connect to the bus.
3. The Northbridge asserts CONNECT.
4. The Northbridge deasserts CLKFWDRST, synchronizing the forwarded clocks between the processor and the Northbridge.
5. The processor issues a Connect special cycle on the system bus and resumes operating system and application code execution.

Connect State Diagram

Figure 6 below and Figure 7 on page 17 show the Northbridge and processor connect state diagrams, respectively.

	Condition
1	A disconnect is requested and probes are still pending.
2	A disconnect is requested and no probes are pending.
3	A Connect special cycle from the processor.
4	No probes are pending.
5	PROCRDY is deasserted.
6	A probe needs service.
7	PROCRDY is asserted.
8	Three SYSCLK periods after CLKFWDRST is deasserted. *Although reconnected to the system interface, the Northbridge must not issue any non-NOP SysDC commands for a minimum of four SYSCLK periods after deasserting CLKFWDRST.*

	Action
A	Deassert CONNECT eight SYSCLK periods after last SysDC sent.
B	Assert CLKFWDRST.
C	Assert CONNECT.
D	Deassert CLKFWDRST.

Figure 6. Northbridge Connect State Diagram

	Condition
1	CONNECT is deasserted by the Northbridge (for a previously sent Halt or Stop Grant special cycle).
2	Processor receives a wake-up event and must cancel the disconnect request.
3	Deassert PROCRDY and slow down internal clocks.
4	Processor wake-up event or CONNECT asserted by Northbridge.
5	CLKFWDRST is deasserted by the Northbridge.
6	Forward clocks start three SYSCLK periods after CLKFWDRST is deasserted.

	Action
A	CLKFWDRST is asserted by the Northbridge.
B	Issue a Connect special cycle.*
C	Return internal clocks to full speed and assert PROCRDY.

Note:

* *The Connect special cycle is only issued after a processor wake-up event (interrupt or STPCLK# deassertion) occurs. If the AMD Athlon™ system bus is connected so the Northbridge can probe the processor, a Connect special cycle is not issued at that time (it is only issued after a subsequent processor wake-up event).*

Figure 7. Processor Connect State Diagram

4.3 Clock Control

The processor implements a Clock Control (CLK_Ctl) MSR (address C001_001Bh) that determines the internal clock divisor when the AMD Athlon system bus is disconnected.

Refer to the *AMD Athlon™ and AMD Duron™ Processors BIOS, Software, and Debug Developers Guide*, order# 21656, for more details on the CLK_Ctl register.

5 CPUID Support

AMD Athlon™ XP processor model 8 version and feature set recognition can be performed through the use of the CPUID instruction, that provides complete information about the processor—vendor, type, name, etc., and its capabilities. Software can make use of this information to accurately tune the system for maximum performance and benefit to users.

For information on the use of the CPUID instruction see the following documents:

- *AMD Processor Recognition Application Note*, order# 20734
- *AMD Athlon™ Processor Recognition Application Note Addendum*, order# 21922

6 Advanced 266 Front-Side Bus AMD Athlon™ XP Processor Model 8 Specifications

This chapter describes the electrical specifications that are unique to the advanced 266 front-side bus (FSB) AMD Athlon™ XP processor model 8.

6.1 Part-Specific Electrical and Thermal Specifications for Advanced 266 FSB AMD Athlon™ XP Processors Model 8

This section provides part-specific electrical and thermal information for each type of the Advanced 266 FSB AMD Athlon XP processors model 8 in Table 1 on page 22 and Table 2 on page 23.

Table 1 shows the part-specific electrical and thermal specifications in the C0 working state and the S1 Stop Grant state for processors with a CPUID = 680.

Table 1. Electrical and Thermal Specifications for Processors with a CPUID of 680

Frequency in MHz (Model Number)	V_{CC_CORE} (Core Voltage)	I_{CC} (Processor Current)				Thermal Power[5]		Maximum Die Temperature

Notes:

1. *See Figure 3, "AMD Athlon™ XP Processor Model 8 Power Management States" on page 9.*
2. *The maximum Stop Grant currents are absolute worst case currents for parts that may yield from the worst case corner of the process and are not representative of the typical Stop Grant current that is currently about one-third of the maximum specified current.*
3. *These currents occur when the AMD Athlon™ system bus is disconnected and has a low power ratio of 1/8 for Stop Grant disconnect and a low power ratio of 1/8 Halt disconnect applied to the core clock grid of the processor as dictated by a value of 6003_1223h programmed into the Clock Control (CLK_Ctl) MSR. For more information, refer to the* AMD Athlon™ and AMD Duron™ Processors BIOS, Software, and Debug Developers Guide*, order# 21656.*
4. *The Stop Grant current consumption is characterized at 50°C and not tested.*
5. *Thermal design power represents the maximum sustained power dissipated while executing publicly-available software or instruction sequences under normal system operation at nominal V_{CC_CORE}. Thermal solutions must monitor the temperature of the processor to prevent the processor from exceeding its maximum die temperature.*

Table 2 shows the part-specific electrical and thermal specifications in the C0 working state and the S1 Stop Grant state for processors with a CPUID = 681

6.2 Advanced 266 FSB AMD Athlon™ XP Processor Model 8 SYSCLK and SYSCLK# AC Characteristics

Table 3 shows the SYSCLK/SYSCLK# differential clock AC characteristics of this processor.

Table 3. SYSCLK and SYSCLK# AC Characteristics

Symbol	Parameter Description	Minimum	Maximum	Units	Notes
	Clock Frequency	50	133	MHz	1
	Duty Cycle	30%	70%		
t_1	Period	7.5		ns	2, 3
t_2	High Time	1.05		ns	
t_3	Low Time	1.05		ns	
t_4	Fall Time		2	ns	
t_5	Rise Time		2	ns	
	Period Stability		± 300	ps	

Notes:

1. *The AMD Athlon™ system bus operates at twice this clock frequency.*
2. *Circuitry driving the AMD Athlon system bus clock inputs must exhibit a suitably low closed-loop jitter bandwidth to allow the PLL to track the jitter. The –20dB attenuation point, as measured into a 20- or 30-pF load must be less than 500 kHz.*
3. *Circuitry driving the AMD Athlon system bus clock inputs may purposely alter the AMD Athlon system bus clock frequency (spread spectrum clock generators). In no cases can the AMD Athlon system bus period violate the minimum specification above. AMD Athlon system bus clock inputs can vary from 100% of the specified frequency to 99% of the specified frequency at a maximum rate of 100 kHz.*

Notes:

1. *Rise and fall time ranges are guidelines over which the I/O has been characterized.*
2. *$T_{SKEW-SAMEEDGE}$ is the maximum skew within a clock forwarded group between any two signals or between any signal and its forward clock, as measured at the package, with respect to the same clock edge.*
   $T_{SKEW-DIFFEDGE}$ is the maximum skew within a clock forwarded group between any two signals or between any signal and its forward clock, as measured at the package, with respect to different clock edges.
3. *Input SU and HD times are with respect to the appropriate Clock Forward Group input clock.*
4. *The synchronous signals include PROCRDY, CONNECT, and CLKFWDRST.*
5. *T_{VAL} is RSTCLK rising edge to output valid for PROCRDY. Test Load is 25 pF.*
6. *T_{SU} is setup of CONNECT/CLKFWDRST to rising edge of RSTCLK. T_{HD} is hold of CONNECT/CLKFWDRST from rising edge of RSTCLK.*

7 Advanced 333 Front-Side Bus AMD Athlon™ XP Processor Model 8 Specifications

This chapter describes the electrical specifications that are unique to the advanced 333 front-side bus (FSB) AMD Athlon™ XP processor model 8.

7.1 Electrical and Thermal Specifications for the Advanced 333 FSB AMD Athlon™ XP Processor Model 8

Table 5 shows the electrical and thermal specifications for this processor in the C0 working state and the S1 Stop Grant state.

8 Electrical Data

This chapter describes the electrical characteristics that apply to all desktop AMD Athlon™ XP processors model 8.

8.1 Conventions

The conventions used in this chapter are as follows:

- Current specified as being sourced by the processor is *negative*.
- Current specified as being sunk by the processor is *positive*.

8.2 Interface Signal Groupings

The electrical data in this chapter is presented separately for each signal group.

Table 8 defines each group and the signals contained in each group.

Table 8. Interface Signal Groupings

Signal Group	Signals	Notes
AMD Athlon™ System Bus	SADDIN[14:2]#, SADDOUT[14:2]#, SADDINCLK#, SADDOUTCLK#, SFILLVAL#, SDATAINVAL#, SDATAOUTVAL#, SDATA[63:0]#, SDATAINCLK[3:0]#, SDATAOUTCLK[3:0]#, CLKFWDRST, PROCRDY, CONNECT	See "Advanced 266 FSB AMD Athlon™ System Bus AC Characteristics" on page 25, "Advanced 333 FSB AMD Athlon™ System Bus AC Characteristics" on page 29, "AMD Athlon™ System Bus DC Characteristics" on page 36, and "CLKFWDRST Pin" on page 73.

8.3 Voltage Identification (VID[4:0])

Table 9 shows the VID[4:0] DC Characteristics. For more information on VID[4:0] DC Characteristics, see "VID[4:0] Pins" on page 78.

Table 9. VID[4:0] DC Characteristics

Parameter	Description	Min	Max
I_{OL}	Output Current Low	6 mA	
V_{OH}	Output High Voltage	–	5.25 V *

Note:
* *The VID pins are either open circuit or pulled to ground. It is recommended that these pins are not pulled above 5.25 V, which is 5.0 V + 5%.*

8.4 Frequency Identification (FID[3:0])

Table 10 shows the FID[3:0] DC characteristics. For more information, see "FID[3:0] Pins" on page 75.

Table 10. FID[3:0] DC Characteristics

Parameter	Description	Min	Max
I_{OL}	Output Current Low	6 mA	
V_{OH}	Output High Voltage	–	2.625 V *

Note:
* *The FID pins must not be pulled above this voltage by an external pullup resistor.*

8.5 VCCA AC and DC Characteristics

Table 11 shows the AC and DC characteristics for VCCA. For more information, see "VCCA Pin" on page 78.

Table 11. VCCA AC and DC Characteristics

Symbol	Parameter	Min	Nominal	Max	Units	Notes
V_{VCCA}	VCCA Pin Voltage	2.25	2.5	2.75	V	1
I_{VCCA}	VCCA Pin Current	0		50	mA/GHz	2

Notes:
1. *Minimum and Maximum voltages are absolute. No transients below minimum nor above maximum voltages are permitted.*
2. *Measured at 2.5 V.*

8.6 Decoupling

See the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363, or contact your local AMD office for information about the decoupling required on the motherboard for use with the AMD Athlon™ XP processor model 8.

8.7 V_{CC_CORE} Characteristics

Table 12 shows the AC and DC characteristics for V_{CC_CORE}. See Figure 10 on page 35 for a graphical representation of the V_{CC_CORE} waveform.

Table 12. V_{CC_CORE} AC and DC Characteristics

Symbol	Parameter	Limit in Working State	Units
$V_{CC\_CORE\_DC\_MAX}$	Maximum static voltage above $V_{CC\_CORE\_NOM}$*	50	mV
$V_{CC\_CORE\_DC\_MIN}$	Maximum static voltage below $V_{CC\_CORE\_NOM}$*	–50	mV
$V_{CC\_CORE\_AC\_MAX}$	Maximum excursion above $V_{CC\_CORE\_NOM}$*	150	mV
$V_{CC\_CORE\_AC\_MIN}$	Maximum excursion below $V_{CC\_CORE\_NOM}$*	–100	mV
t_{MAX_AC}	Maximum excursion time for AC transients	10	µs
t_{MIN_AC}	Negative excursion time for AC transients	5	µs

Note:
** All voltage measurements are taken differentially at the COREFB/COREFB# pins.*

Figure 10 shows the processor core voltage (V_{CC_CORE}) waveform response to perturbation. The t_{min_AC} (negative AC transient excursion time) and t_{max_AC} (positive AC transient excursion time) represent the maximum allowable time below or above the DC tolerance thresholds.

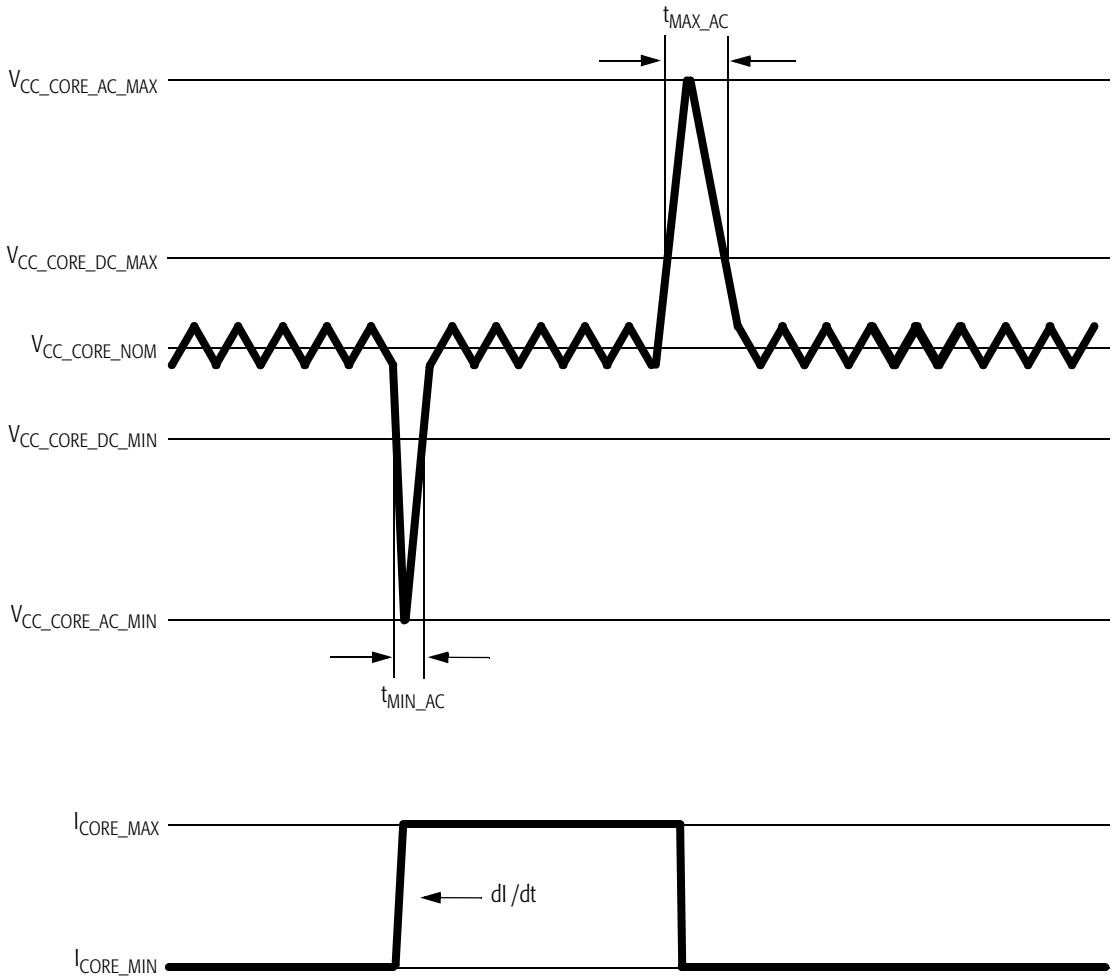

Figure 10. V_{CC_CORE} Voltage Waveform

8.8 Absolute Ratings

The AMD Athlon XP processor model 8 should not be subjected to conditions exceeding the absolute ratings, as such conditions can adversely affect long-term reliability or result in functional damage.

Table 13 lists the maximum absolute ratings of operation for the AMD Athlon XP processor model 8.

Table 13. Absolute Ratings

Parameter	Description	Min	Max
V_{CC_CORE}	AMD Athlon™ XP processor model 8 core supply	–0.5 V	V_{CC_CORE} Max + 0.5 V
VCCA	AMD Athlon XP processor model 8 PLL supply	–0.5 V	VCCA Max + 0.5 V
V_{PIN}	Voltage on any signal pin	–0.5 V	V_{CC_CORE} Max + 0.5 V
$T_{STORAGE}$	Storage temperature of processor	–40ºC	100ºC

8.9 SYSCLK and SYSCLK# DC Characteristics

Table 14 shows the DC characteristics of the SYSCLK and SYSCLK# differential clocks. The SYSCLK signal represents CLKIN and RSTCLK tied together while the SYSCLK# signal represents CLKIN# and RSTCLK# tied together. For information about SYSCLK and SYSCLK#, see "SYSCLK and SYSCLK#" on page 79 and Table 24, "Pin Name Abbreviations," on page 58.

Table 14. SYSCLK and SYSCLK# DC Characteristics

Symbol	Description	Min	Max	Units
$V_{Threshold-DC}$	Crossing before transition is detected (DC)	400		mV
$V_{Threshold-AC}$	Crossing before transition is detected (AC)	450		mV
I_{LEAK_P}	Leakage current through P-channel pullup to V_{CC_CORE}	–1		mA
I_{LEAK_N}	Leakage current through N-channel pulldown to VSS (Ground)		1	mA
V_{CROSS}	Differential signal crossover		V_{CC_CORE} / 2±100	mV
C_{PIN}	Capacitance *	4	25 *	pF

Note:

* *The following processor inputs have twice the listed capacitance because they connect to two input pads–SYSCLK and SYSCLK#. SYSCLK connects to CLKIN/RSTCLK. SYSCLK# connects to CLKIN#/RSTCLK#.*

Figure 11 shows the DC characteristics of the SYSCLK and SYSCLK# signals.

8.10 AMD Athlon™ System Bus DC Characteristics

Table 15 shows the DC characteristics of the AMD Athlon system bus used by the AMD Athlon XP processor model 8.

Table 15. AMD Athlon™ System Bus DC Characteristics

Symbol	Parameter	Condition	Min	Max	Units	Notes
V_{REF}	DC Input Reference Voltage		$(0.5 \times V_{CC\_CORE}) - 50$	$(0.5 \times V_{CC\_CORE}) + 50$	mV	1
$I_{VREF\_LEAK\_P}$	V_{REF} Tristate Leakage Pullup	$V_{IN} = V_{REF}$ Nominal	–100		µA	
$I_{VREF\_LEAK\_N}$	V_{REF} Tristate Leakage Pulldown	$V_{IN} = V_{REF}$ Nominal		100	µA	
V_{IH}	Input High Voltage		V_{REF} + 200	V_{CC_CORE} + 500	mV	
V_{IL}	Input Low Voltage		–500	V_{REF} – 200	mV	
I_{LEAK_P}	Tristate Leakage Pullup	V_{IN} = VSS (Ground)	–1		mA	
I_{LEAK_N}	Tristate Leakage Pulldown	$V_{IN} = V_{CC\_CORE}$ Nominal		1	mA	
C_{IN}	Input Pin Capacitance		4	7	pF	
R_{ON}	Output Resistance		$0.90 \times R_{setN,P}$	$1.1 \times R_{setN,P}$	Ω	2
R_{setP}	Impedance Set Point, P Channel		40	70	Ω	2
R_{setN}	Impedance Set Point, N Channel		40	70	Ω	2

Notes:

1. *V_{REF} is nominally set to 50% of V_{CC_CORE} with actual values that are specific to motherboard design implementation. V_{REF} must be created with a sufficiently accurate DC source and a sufficiently quiet AC response to adhere to the ± 50 mV specification listed above.*
2. *Measured at V_{CC_CORE} / 2.*

8.11 General AC and DC Characteristics

Table 16 shows the AMD Athlon XP processor model 8 AC and DC characteristics of the Southbridge, JTAG, test, and miscellaneous pins.

Table 16. General AC and DC Characteristics

Symbol	Parameter Description	Condition	Min	Max	Units	Notes
V_{IH}	Input High Voltage		(V_{CC_CORE} / 2) + 200 mV	V_{CC_CORE} + 300 mV	V	1, 2
V_{IL}	Input Low Voltage		–300	350	mV	1, 2
V_{OH}	Output High Voltage		V_{CC_CORE} – 400	V_{CC_CORE} + 300	mV	
V_{OL}	Output Low Voltage		–300	400	mV	
I_{LEAK_P}	Tristate Leakage Pullup	V_{IN} = VSS (Ground)	–1		mA	
I_{LEAK_N}	Tristate Leakage Pulldown	V_{IN} = V_{CC_CORE} Nominal		600	µA	
I_{OH}	Output High Current			–6	mA	3
I_{OL}	Output Low Current		6		mA	3
T_{SU}	Sync Input Setup Time		2.0		ns	4, 5
T_{HD}	Sync Input Hold Time		0.0		ps	4, 5
T_{DELAY}	Output Delay with respect to RSTCLK		0.0	6.1	ns	5

Notes:

1. *Characterized across DC supply voltage range.*
2. *Values specified at nominal V_{CC_CORE}. Scale parameters between $V_{CC\_CORE.}$ minimum and $V_{CC\_CORE.}$ maximum.*
3. *I_{OL} and I_{OH} are measured at V_{OL} maximum and V_{OH} minimum, respectively.*
4. *Synchronous inputs/outputs are specified with respect to RSTCLK and RSTCK# at the pins.*
5. *These are aggregate numbers.*
6. *Edge rates indicate the range over which inputs were characterized.*
7. *In asynchronous operation, the signal must persist for this time to enable capture.*
8. *This value assumes RSTCLK period is 10 ns ⟹ TBIT = 2*fRST.*
9. *The approximate value for standard case in normal mode operation.*
10. *This value is dependent on RSTCLK frequency, divisors, Low Power mode, and core frequency.*
11. *Reassertions of the signal within this time are not guaranteed to be seen by the core.*
12. *This value assumes that the skew between RSTCLK and K7CLKOUT is much less than one phase.*
13. *This value assumes RSTCLK and K7CLKOUT are running at the same frequency, though the processor is capable of other configurations.*
14. *Time to valid is for any open-drain pins. See requirements 7 and 8 in the "Power-Up Timing Requirements" chapter for more information.*

Table 16. General AC and DC Characteristics (continued)

Symbol	Parameter Description	Condition	Min	Max	Units	Notes
T_{BIT}	Input Time to Acquire		20.0		ns	7, 8
T_{RPT}	Input Time to Reacquire		40.0		ns	9–13
T_{RISE}	Signal Rise Time		1.0	3.0	V/ns	6
T_{FALL}	Signal Fall Time		1.0	3.0	V/ns	6
C_{PIN}	Pin Capacitance		4	12	pF	
T_{VALID}	Time to data valid			100	ns	14

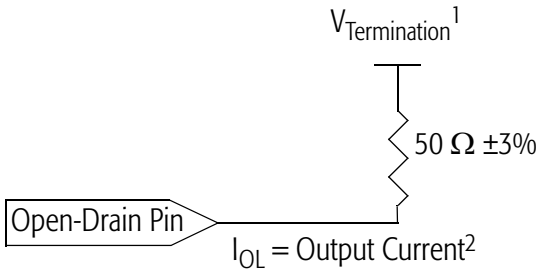
Notes:

1. *Characterized across DC supply voltage range.*
2. *Values specified at nominal V_{CC_CORE}. Scale parameters between $V_{CC\_CORE.}$ minimum and $V_{CC\_CORE.}$ maximum.*
3. *I_{OL} and I_{OH} are measured at V_{OL} maximum and V_{OH} minimum, respectively.*
4. *Synchronous inputs/outputs are specified with respect to RSTCLK and RSTCK# at the pins.*
5. *These are aggregate numbers.*
6. *Edge rates indicate the range over which inputs were characterized.*
7. *In asynchronous operation, the signal must persist for this time to enable capture.*
8. *This value assumes RSTCLK period is 10 ns ==> TBIT = 2*fRST.*
9. *The approximate value for standard case in normal mode operation.*
10. *This value is dependent on RSTCLK frequency, divisors, Low Power mode, and core frequency.*
11. *Reassertions of the signal within this time are not guaranteed to be seen by the core.*
12. *This value assumes that the skew between RSTCLK and K7CLKOUT is much less than one phase.*
13. *This value assumes RSTCLK and K7CLKOUT are running at the same frequency, though the processor is capable of other configurations.*
14. *Time to valid is for any open-drain pins. See requirements 7 and 8 in the "Power-Up Timing Requirements" chapter for more information.*

8.12 Open-Drain Test Circuit

Figure 12 is a test circuit that may be used on automated test equipment (ATE) to test for validity on open drain pins.

Refer to Table 16, "General AC and DC Characteristics," on page 39 for timing requirements.



Notes:

1. *$V_{Termination}$ = 1.2 V for VID and FID pins*
   $V_{Termination}$ = 1.0 V for APIC pins
2. *I_{OL} = –6 mA for VID and FID pins*
   I_{OL} = –9 mA for APIC pins

8.13 Thermal Diode Characteristics

The AMD Athlon XP processor model 8 provides a diode that can be used in conjunction with an external temperature sensor to determine the die temperature of the processor. The diode anode (THERMDA) and cathode (THERMDC) are available as pins on the processor, as described in "THERMDA and THERMDC Pins" on page 78.

For information about thermal design for the AMD Athlon XP processor model 8, including layout and airflow considerations, see the *AMD Processor Thermal, Mechanical, and Chassis Cooling Design Guide*, order# 23794, and the cooling guidelines on *http://www.amd.com*.

Thermal Diode Electrical Characteristics

Table 17 shows the AMD Athlon XP processor model 8 characteristics of the on-die thermal diode. For information about calculations for the ideal diode equation and temperature offset correction, see Appendix A, "Thermal Diode Calculations," on page 77.

$n_{f, lumped}$	Lumped ideality factor	1.00000	1.00374	1.00900		2, 3, 4
$n_{f, actual}$	Actual ideality factor		1.00261			3, 4
R_T	Series Resistance		0.93		Ω	3, 4

Notes:

1. *The sourcing current should always be used in forward bias only.*
2. *Characterized at 95°C with a forward bias current pair of 10 µA and 100 µA. AMD recommends using a minimum of two sourcing currents to accurately measure the temperature of the thermal diode.*
3. *Not 100% tested. Specified by design and limited characterization.*
4. *The lumped ideality factor adds the effect of the series resistance term to the actual ideality factor. The series resistance term indicates the resistance from the pins of the processor to the on-die thermal diode. The value of the lumped ideality factor depends on the sourcing current pair used.*

Thermal Protection Characterization

The following section describes parameters relating to thermal protection. The implementation of thermal control circuitry to control processor temperature is left to the manufacturer to determine how to implement.

Thermal limits in motherboard design are necessary to protect the processor from thermal damage. $T_{SHUTDOWN}$ is the temperature for thermal protection circuitry to initiate shutdown of the processor. T_{SD_DELAY} is the maximum time allowed from the detection of the over-temperature condition to processor shutdown to prevent thermal damage to the processor.

Systems that do not implement thermal protection circuitry or that do not react within the time specified by T_{SD_DELAY} can cause thermal damage to the processor during the unlikely events of fan failure or powering up the processor without a heat-sink. The processor relies on thermal circuitry on the motherboard to turn off the regulated core voltage to the processor in response to a thermal shutdown event.

Thermal protection circuitry reference designs and thermal solution guidelines are found in the following documents:

- *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363
- *AMD Thermal, Mechanical, and Chassis Cooling Design Guide*, order# 23794

See *http://www.amd.com* for more information about thermal solutions.

Table 18 on page 44 shows the $T_{SHUTDOWN}$ and T_{SD_DELAY} specifications for circuitry in motherboard design necessary for thermal protection of the processor.

Table 18. Guidelines for Platform Thermal Protection of the Processor

Symbol	Parameter Description	Max	Units	Notes
$T_{SHUTDOWN}$	Thermal diode shutdown temperature for processor protection	125	°C	1, 2, 3
T_{SD_DELAY}	Maximum allowed time from $T_{SHUTDOWN}$ detection to processor shutdown	500	ms	1, 3

Notes:
1. *The thermal diode is not 100% tested, it is specified by design and limited characterization.*
2. *The thermal diode is capable of responding to thermal events of 40°C/s or faster.*
3. *The AMD Athlon™ XP processor model 8 provides a thermal diode for measuring die temperature of the processor. The processor relies on thermal circuitry on the motherboard to turn off the regulated core voltage to the processor in response to a thermal shutdown event. Refer to* AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363, for thermal protection circuitry designs.*

8.14 APIC Pins AC and DC Characteristics

Table 19 shows the AMD Athlon XP processor model 8 AC and DC characteristics of the APIC pins.

2. *The 2.625-V value is equal to 2.5 V plus a maximum of five percent.*
3. *Edge rates indicate the range for characterizing the inputs.*

9 Signal and Power-Up Requirements

The AMD Athlon™ XP processor model 8 is designed to provide functional operation if the voltage and temperature parameters are within the limits of normal operating ranges.

9.1 Power-Up Requirements

Signal Sequence and Timing Description

Figure 13 shows the relationship between key signals in the system during a power-up sequence. This figure details the requirements of the processor.

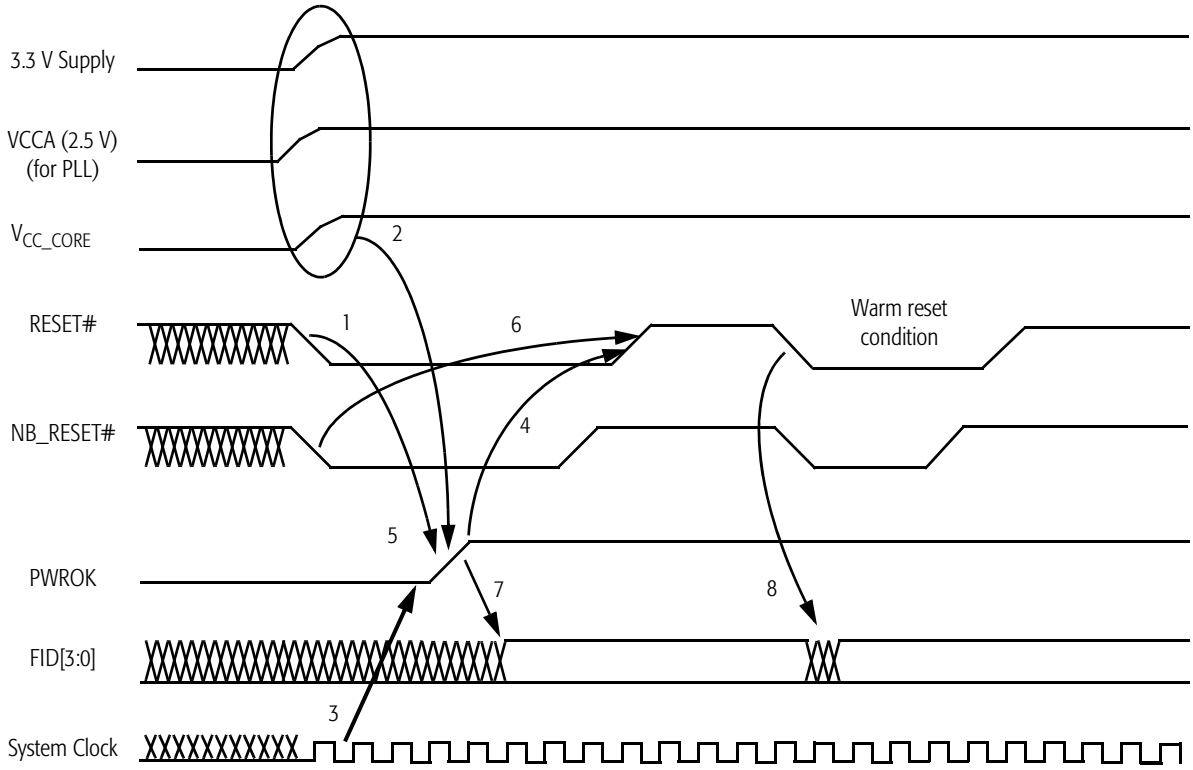

Figure 13. Signal Relationship Requirements During Power-Up Sequence

Notes: ***1.*** *Figure 13 represents several signals generically by using names not necessarily consistent with any pin lists or schematics.*

2. *Requirements 1–8 in Figure 13 are described in "Power-Up Timing Requirements" on page 46.*

Power-Up Timing Requirements. The signal timing requirements are as follows:

1. RESET# must be asserted before PWROK is asserted.

   The AMD Athlon XP processor model 8 does not set the correct clock multiplier if PWROK is asserted prior to a RESET# assertion. It is recommended that RESET# be asserted at least **10 nanoseconds** prior to the assertion of PWROK.

   In practice, a Southbridge asserts RESET# milliseconds before PWROK is asserted.

2. All motherboard voltage planes must be within specification before PWROK is asserted.

   PWROK is an output of the voltage regulation circuit on the motherboard. PWROK indicates that V_{CC_CORE} and all other voltage planes in the system are within specification.

   The motherboard is required to delay PWROK assertion for a minimum of three milliseconds from the 3.3 V supply being within specification. This delay ensures that the system clock (SYSCLK/SYSCLK#) is operating within specification when PWROK is asserted.

   The processor core voltage, V_{CC_CORE}, must be within specification as dictated by the VID[4:0] pins driven by the processor before PWROK is asserted. Before PWROK assertion, the AMD Athlon processor is clocked by a ring oscillator.

   The processor PLL is powered by VCCA. The processor PLL does not lock if VCCA is not high enough for the processor logic to switch for some period before PWROK is asserted. VCCA must be within specification at least five microseconds before PWROK is asserted.

   In practice VCCA, V_{CC_CORE}, and all other voltage planes must be within specification for several milliseconds before PWROK is asserted.

   After PWROK is asserted, the processor PLL locks to its operational frequency.

3. The system clock (SYSCLK/SYSCLK#) must be running before PWROK is asserted.

   When PWROK is asserted, the processor switches from driving the internal processor clock grid from the ring oscillator to driving from the PLL. The reference system

clock must be valid at this time. The system clocks are designed to be running after 3.3 V has been within specification for three milliseconds.

4. PWROK assertion to deassertion of RESET#

   The duration of RESET# assertion during cold boots is intended to satisfy the time it takes for the PLL to lock with a less than 1 ns phase error. The processor PLL begins to run after PWROK is asserted and the internal clock grid is switched from the ring oscillator to the PLL. The PLL lock time may take from hundreds of nanoseconds to tens of microseconds. It is recommended that the minimum time between PWROK assertion to the deassertion of RESET# be at least **1.0 milliseconds**. Southbridges enforce a delay of 1.5 to 2.0 milliseconds between PWRGD (Southbridge version of PWROK) assertion and NB_RESET# deassertion.

5. PWROK must be monotonic and meet the timing requirements as defined in Table 16, "General AC and DC Characteristics," on page 39. The processor should not switch between the ring oscillator and the PLL after the initial assertion of PWROK.

6. NB_RESET# must be asserted (causing CONNECT to also assert) before RESET# is deasserted. In practice all Southbridges enforce this requirement.

   If NB_RESET# does not assert until after RESET# has deasserted, the processor misinterprets the CONNECT assertion (due to NB_RESET# being asserted) as the beginning of the SIP transfer. There must be sufficient overlap in the resets to ensure that CONNECT is sampled asserted by the processor before RESET# is deasserted.

7. The FID[3:0] signals are valid within 100 ns after PWROK is asserted. The chipset must not sample the FID[3:0] signals until they become valid. Refer to the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363, for the specific implementation and additional circuitry required.

8. The FID[3:0] signals become valid within 100 ns after RESET# is asserted. Refer to the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363, for the specific implementation and additional circuitry required.

Clock Multiplier Selection (FID[3:0])

The chipset samples the FID[3:0] signals in a chipset-specific manner from the processor and uses this information to determine the correct serial initialization packet (SIP). The chipset then sends the SIP information to the processor for configuration of the AMD Athlon system bus for the clock multiplier that determines the processor frequency indicated by the FID[3:0] code. The SIP is sent to the processor using the SIP protocol. This protocol uses the PROCRDY, CONNECT, and CLKFWDRST signals, that are synchronous to SYSCLK.

For more information about FID[3:0], see "FID[3:0] Pins" on page 75.

Serial Initialization Packet (SIP) Protocol. Refer to *AMD Athlon™ System Bus Specification*, order# 21902 for details of the SIP protocol.

9.2 Processor Warm Reset Requirements

Northbridge Reset Pins

RESET# cannot be asserted to the processor without also being asserted to the Northbridge. RESET# to the Northbridge is the same as PCI RESET#. The minimum assertion for PCI RESET# is one millisecond. Southbridges enforce a minimum assertion of RESET# for the processor, Northbridge, and PCI of 1.5 to 2.0 milliseconds.

10 Mechanical Data

The AMD Athlon™ XP processor model 8 connects to the motherboard through a Pin Grid Array (PGA) socket named Socket A. This processor utilizes the organic pin grid array (OPGA) package type described in this chapter. For more information, see the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

10.1 Die Loading

The processor die on the OPGA package is exposed at the top of the package. This feature facilitates heat transfer from the die to an approved heat sink. Any heat sink design should avoid loads on corners and edges of die. The OPGA package has compliant pads that serve to bring surfaces in planar contact. Tool-assisted zero insertion force sockets should be designed so that no load is placed on the substrate of the package.

Table 20 shows the mechanical loading specifications for the processor die. It is critical that the mechanical loading of the heat sink does not exceed the limits shown in Table 20.

11 Pin Descriptions

This chapter includes pin diagrams of the organic pin grid array (OPGA) for the AMD Athlon™ XP processor model 8, a listing of pin name abbreviations, and a cross-referenced listing of pin locations to signal names.

11.1 Pin Diagram and Pin Name Abbreviations

Figure 16 on page 56 shows the staggered pin grid array (PGA) for the AMD Athlon™ XP processor model 8. Because some of the pin names are too long to fit in the grid, they are abbreviated. Figure 17 on page 57 shows the bottomside view of the array. Table 24 on page 58 lists all the pins in alphabetical order by pin name, along with the abbreviation where necessary.

11.2 Pin List

Table 25 on page 66 cross-references Socket A pin location to signal name.

The “L” (Level) column shows the electrical specification for this pin. “P” indicates a push-pull mode driven by a single source. “O” indicates open-drain mode that allows devices to share the pin.

Note: *The AMD Athlon processor supports push-pull drivers. For more information, see “Push-Pull (PP) Drivers” on page 6.*

The “P” (Port) column indicates if this signal is an input (I), output (O), or bidirectional (B) signal. The “R” (Reference) column indicates if this signal should be referenced to VSS (G) or V_{CC_CORE} (P) planes for the purpose of signal routing with respect to the current return paths.

11.3 Detailed Pin Descriptions

The information in this section pertains to Table 25 on page 66.

A20M# Pin

A20M# is an input from the system used to simulate address wrap-around in the 20-bit 8086.

AMD Pin

AMD Socket A processors do not implement a pin at location AH6. All Socket A designs must have a top plate or cover that blocks this pin location. When the cover plate blocks this location, a non-AMD part (e.g., PGA370) does not fit into the socket. However, socket manufacturers are allowed to have a contact loaded in the AH6 position. Therefore, motherboard socket design should account for the possibility that a contact could be loaded in this position.

AMD Athlon™ System Bus Pins

See the *AMD Athlon™ System Bus Specification*, order# 21902 for information about the system bus pins—PROCRDY, PWROK, RESET#, SADDIN[14:2]#, SADDINCLK#, SADDOUT[14:2]#, SADDOUTCLK#, SDATA[63:0]#, SDATAINCLK[3:0]#, SDATAINVALID#, SDATAOUTCLK[3:0]#, SDATAOUTVALID#, SFILLVALID#.

Analog Pin

Treat this pin as a NC.

APIC Pins, PICCLK, PICD[1:0]#

The Advanced Programmable Interrupt Controller (APIC) is a feature that provides a flexible and expandable means of delivering interrupts in a system using an AMD processor. The pins, PICD[1:0], are the bi-directional message-passing signals used for the APIC and are driven to the Southbridge or a dedicated I/O APIC. The pin, PICCLK, must be driven with a valid clock input.

For more information, see Table 19, “APIC Pin AC and DC Characteristics,” on page 44.

CLKFWDRST Pin

CLKFWDRST resets clock-forward circuitry for both the system and processor.

CLKIN, RSTCLK (SYSCLK) Pins

Connect CLKIN with RSTCLK and name it SYSCLK. Connect CLKIN# with RSTCLK# and name it SYSCLK#. Length match the clocks from the clock generator to the Northbridge and processor.

See “SYSCLK and SYSCLK#” on page 79 for more information.

CONNECT Pin

CONNECT is an input from the system used for power management and clock-forward initialization at reset.

COREFB and COREFB# Pins

COREFB and COREFB# are outputs to the system that provide processor core voltage feedback to the system.

CPU_PRESENCE# Pin

CPU_PRESENCE# is connected to VSS on the processor package. If pulled-up on the motherboard, CPU_PRESENCE# may be used to detect the presence or absence of a processor in the Socket A-style socket.

DBRDY and DBREQ# Pins

DBRDY and DBREQ# are routed to the debug connector. DBREQ# is tied to V_{CC_CORE} with a pullup resistor.

FERR Pin

FERR is an output to the system that is asserted for any unmasked numerical exception independent of the NE bit in CR0. FERR is a push-pull active High signal that must be inverted and level shifted to an active Low signal. For more information about FERR and FERR#, see the "Required Circuits" chapter of the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

FID[3:0] Pins

FID[3] (Y3), FID[2] (Y1), FID[1] (W3), and FID[0] (W1) are the 4-bit processor clock-to-SYSCLK ratio.

Table 26 on page 76 shows the encodings of the clock multipliers on FID[3:0].

Table 26. FID[3:0] Clock Multiplier Encodings

FID[3:0][2]	Processor Clock to SYSCLK Frequency Ratio
0000	11
0001	11.5
0010	12
0011	≥ 12.5[1]
0100	5
0101	5.5
0110	6
0111	6.5
1000	7
1001	7.5
1010	8
1011	8.5
1100	9
1101	9.5
1110	10
1111	10.5

Notes:

1. *All ratios greater than or equal to 12.5x have the same FID[3:0] code of 0011b, which causes the SIP configuration for all ratios of 12.5x or greater to be the same.*
2. *BIOS initializes the CLK_Ctl MSR during the POST routine. This CLK_Ctl setting is used with all FID combinations and selects a Halt disconnect divisor and a Stop Grant disconnect divisor. For more information, refer to the* AMD Athlon™ and AMD Duron™ Processors BIOS, Software, and Debug Developers Guide*, order# 21656.*

The FID[3:0] signals are open-drain processor outputs that are pulled High on the motherboard and sampled by the chipset to determine the SIP (Serialization Initialization Packet) that is sent to the processor. The FID[3:0] signals are valid after PWROK is asserted. The FID[3:0]signals must not be sampled until they become valid. See the *AMD Athlon™ System Bus Specification*, order# 21902 for more information about Serialization Initialization Packets and SIP protocol.

The processor FID[3:0] outputs are open-drain and 2.5-V tolerant. To prevent damage to the processor, if these signals are pulled High to above 2.5 V, they must be electrically isolated from the processor. For information about the FID[3:0] isolation circuit, see the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

See "Frequency Identification (FID[3:0])" on page 33 for the DC characteristics for FID[3:0].

FSB_Sense[1:0] Pins

FSB_Sense[1:0] pins are either open circuit (logic level of 1) or are pulled to ground (logic level of 0) on the processor package with a 1 kΩ resistor. In conjunction with a circuit on the motherboard, these pins may be used to automatically detect the front-side bus (FSB) setting of this processor. Proper detection of the FSB setting requires the implementation of a pull-up resistor on the motherboard. Refer to the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363 and the technical note *FSB_Sense Auto Detection Circuitry for Desktop Processors*, order# TN26673 for more information.

Table 27 is the truth table to determine the FSB of desktop processors.

Table 27. Front-Side Bus Sense Truth Table

FSB_Sense[1]	FSB_Sense[0]	Bus Frequency
1	0	RESERVED
1	1	133 MHz
0	1	166 MHz
0	0	RESERVED

The FSB_Sense[1:0] pins are 3.3-V tolerant.

FLUSH# Pin

FLUSH# must be tied to V_{CC_CORE} with a pullup resistor. If a debug connector is implemented, FLUSH# is routed to the debug connector.

IGNNE# Pin

IGNNE# is an input from the system that tells the processor to ignore numeric errors.

INIT# Pin

INIT# is an input from the system that resets the integer registers without affecting the floating-point registers or the internal caches. Execution starts at 0_FFFF_FFF0h.

INTR Pin

INTR is an input from the system that causes the processor to start an interrupt acknowledge transaction that fetches the 8-bit interrupt vector and starts execution at that location.

JTAG Pins

TCK, TMS, TDI, TRST#, and TDO are the JTAG interface. Connect these pins directly to the motherboard debug connector. Pull TDI, TCK, TMS, and TRST# up to V_{CC_CORE} with pullup resistors.

K7CLKOUT and K7CLKOUT# Pins

K7CLKOUT and K7CLKOUT# are each run for two to three inches and then terminated with a resistor pair: 100 ohms to V_{CC_CORE} and 100 ohms to VSS. The effective termination resistance and voltage are 50 ohms and V_{CC_CORE} /2.

Key Pins

These 16 locations are for processor type keying for forwards and backwards compatibility (G7, G9, G15, G17, G23, G25, N7, Q7, Y7, AA7, AG7, AG9, AG15, AG17, AG27, and AG29). Motherboard designers should treat key pins like NC (No Connect) pins. A socket designer has the option of creating a top mold piece that allows PGA key pins only where designated. However, sockets that populate all 16 key pins must be allowed, so the motherboard must always provide for pins at all key pin locations.

See "NC Pins" for more information.

NC Pins

The motherboard should provide a plated hole for an NC pin. The pin hole should not be electrically connected to anything.

NMI Pin

NMI is an input from the system that causes a non-maskable interrupt.

PGA Orientation Pins

No pin is present at pin locations A1 and AN1. Motherboard designers should not allow for a PGA socket pin at these locations.

For more information, see the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

PLL Bypass and Test Pins

PLLTEST#, PLLBYPASS#, PLLMON1, PLLMON2, PLLBYPASSCLK, and PLLBYPASSCLK# are the PLL bypass and test interface. This interface is tied disabled on the motherboard. All six pin signals are routed to the debug connector. All four processor inputs (PLLTEST#, PLLBYPASS#, PLLMON1, and PLLMON2) are tied to V_{CC_CORE} with pullup resistors.

PWROK Pin

The PWROK input to the processor must not be asserted until all voltage planes in the system are within specification and all system clocks are running within specification.

For more information, Chapter 9, "Signal and Power-Up Requirements" on page 45.

SADDIN[1:0]# and SADDOUT[1:0]# Pins

The AMD Athlon XP processor model 8 does not support SADDIN[1:0]# or SADDOUT[1:0]#. SADDIN[1]# is tied to VCC with pullup resistors, if this bit is not supported by the Northbridge (future models can support SADDIN[1]#). SADDOUT[1:0]# are tied to VCC with pullup resistors if these pins are supported by the Northbridge. For more information, see the *AMD Athlon™ System Bus Specification*, order# 21902.

Scan Pins

SCANSHIFTEN, SCANCLK1, SCANINTEVAL, and SCANCLK2 are the scan interface. This interface is AMD internal and is tied disabled with pulldown resistors to ground on the motherboard.

SMI# Pin

SMI# is an input that causes the processor to enter the system management mode.

STPCLK# Pin

STPCLK# is an input that causes the processor to enter a lower power mode and issue a Stop Grant special cycle.

SYSCLK and SYSCLK#

SYSCLK and SYSCLK# are differential input clock signals provided to the PLL of the processor from a system-clock generator.

See "CLKIN, RSTCLK (SYSCLK) Pins" on page 74 for more information.

THERMDA and THERMDC Pins

Thermal Diode anode and cathode pins are used to monitor the actual temperature of the processor die, providing more accurate temperature control to the system.

See Table 17, "Thermal Diode Electrical Characteristics," on page 42 for more information.

VCCA Pin

VCCA is the processor PLL supply. For information about the VCCA pin, see Table 5, "VCCA AC and DC Characteristics," on page 35 and the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

VID[4:0] Pins

The VID[4:0] (Voltage Identification) outputs are used to dictate the V_{CC_CORE} voltage level. The VID[4:0] pins are strapped to ground or left unconnected on the processor package. The VID[4:0] pins are pulled-up on the motherboard and used by the V_{CC_CORE} DC/DC converter.

The VID codes and corresponding voltage levels are shown in Table 28.

Table 28. VID[4:0] Code to Voltage Definition

VID[4:0]	V_{CC_CORE} (V)	VID[4:0]	V_{CC_CORE} (V)

For more information, see the "Required Circuits" chapter of the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

VREFSYS Pin

VREFSYS (W5) drives the threshold voltage for the system bus input receivers. The value of VREFSYS is system specific. In addition, to minimize V_{CC_CORE} noise rejection from VREFSYS, include decoupling capacitors. For more information, see the *AMD Athlon™ Processor-Based Motherboard Design Guide*, order# 24363.

ZN and ZP Pins

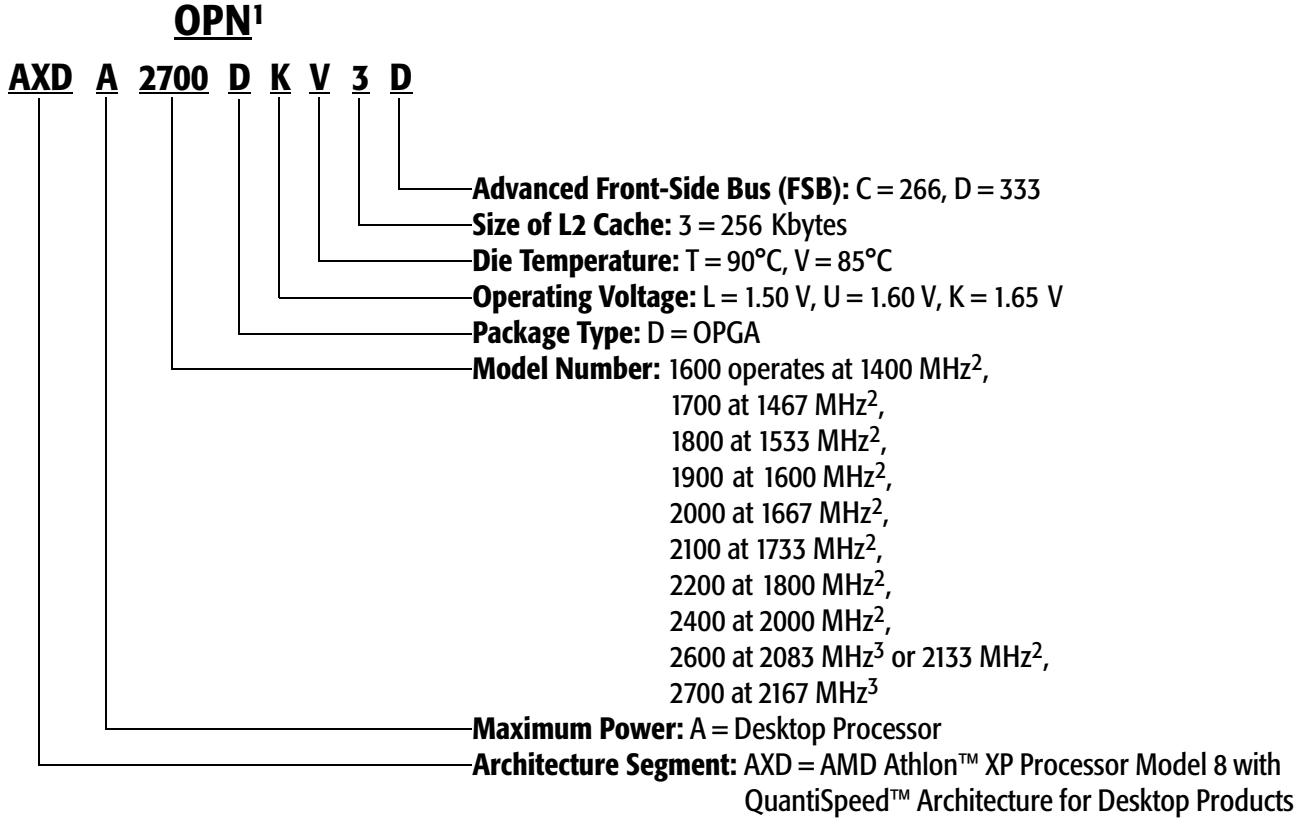
ZN (AC5) and ZP (AE5) are the push-pull compensation circuit pins. In Push-Pull mode (selected by the SIP parameter SysPushPull asserted), ZN is tied to V_{CC_CORE} with a resistor that has a resistance matching the impedance Z_0 of the transmission line. ZP is tied to VSS with a resistor that has a resistance matching the impedance Z_0 of the transmission line.

12 Ordering Information

This section provides the ordering information for the AMD Athlon™ XP processor model 8.

Standard AMD Athlon™ XP Processor Model 8 Products

AMD standard products are available in several operating ranges. The ordering part numbers (OPN) are formed by a combination of the elements, as shown in Figure 18.



Notes:

1. Spaces are added to the number shown above for viewing clarity only.
2. This processor is available only with a 266 advanced FSB.
3. This processor is available only with a 333 advanced FSB.

Thermal Diode Calculations

This section contains information about the calculations for the on-die thermal diode of the AMD Athlon™ XP processor model 8. For electrical information about this thermal diode, see Table 17, "Thermal Diode Electrical Characteristics," on page 42.

Ideal Diode Equation

The ideal diode equation uses the variables and constants defined in Table 29.

Table 29. Constants and Variables for the Ideal Diode Equation

Equation Symbol	Variable, Constant Description
$n_{f,\ lumped}$	Lumped ideality factor
k	Boltzmann constant
q	Electron charge constant
T	Diode temperature (Kelvin)
V_{BE}	Voltage from base to emitter
I_C	Collector current
I_S	Saturation current

Equation (1) shows the ideal diode calculation.

$$V_{BE} = n_{f,\,lumped} \cdot \frac{k}{q} \cdot T \cdot \ln\left(\frac{I_C}{I_S}\right) \quad \textbf{(1)}$$

Sourcing two currents and using Equation (1) derives the difference in the base-to-emitter voltage that leads to finding the diode temperature as shown in Equation (2). The use of dual sourcing currents allows the measurement of the thermal diode temperature to be more accurate and less susceptible to die and process revisions. Temperature sensors that utilize series resistance cancellation can use more than two sourcing currents and are suitable to be used with the AMD thermal diode. Equation (2) is the formula for calculating the temperature of a thermal diode.

$$T = \frac{V_{BE,\,high} - V_{BE,\,low}}{n_{f,\,lumped} \cdot \frac{k}{q} \cdot \ln\left(\frac{I_{high}}{I_{low}}\right)} \quad \textbf{(2)}$$

Temperature Offset Correction

A temperature offset may be required to correct the value measured by a temperature sensor. An offset is necessary if a difference exists between the lumped ideality factor of the processor and the ideality factor assumed by the temperature sensor. The lumped ideality factor can be calculated using the equations in this section to find the temperature offset that should be used with the temperature sensor.

Table 30 shows the constants and variables used to calculate the temperature offset correction.

Table 30. Constants and Variables Used in Temperature Offset Equations

Equation Symbol	Variable, Constant Description
$n_{f,\,actual}$	Actual ideality factor
$n_{f,\,lumped}$	Lumped ideality factor
$n_{f,\,TS}$	Ideality factor assumed by temperature sensor
I_{high}	High sourcing current
I_{low}	Low sourcing current
$T_{die,\,spec}$	Die temperature specification
T_{offset}	Temperature offset

The formulas in Equation (3) and Equation (4) can be used to calculate the temperature offset for temperature sensors that do not employ series resistance cancellation. The result is added to the value measured by the temperature sensor. Contact the vendor of the temperature sensor being used for the value of $n_{f,TS}$. Refer to the document, *On-Die Thermal Diode Characterization*, order# 25443, for further details.

Equation (3) shows the equation for calculating the lumped ideality factor ($n_{f,\,lumped}$) in sensors that do not employ series resistance cancellation.

$$n_{f,\,lumped} = n_{f,\,actual} + \frac{R_T \cdot (I_{high} - I_{low})}{\frac{k}{q}(T_{die,\,spec} + 273.15) \cdot \ln\left(\frac{I_{high}}{I_{low}}\right)} \quad \textbf{(3)}$$

Equation (4) shows the equation for calculating temperature offset (T_{offset}) in sensors that do not employ series resistance cancellation.

$$T_{offset} = (T_{die,\,spec} + 273.15) \cdot \left(1 - \frac{n_{f,\,lumped}}{n_{f,\,TS}}\right) \quad \textbf{(4)}$$

Equation (5) is the temperature offset for temperature sensors that utilize series resistance cancellation. Add the result to the value measured by the temperature sensor. Note that the value of $n_{f,TS}$ in Equation (5) may not equal the value used in Equation (4).

$$T_{offset} = (T_{die,\,spec} + 273.15) \cdot \left(1 - \frac{n_{f,\,actual}}{n_{f,\,TS}}\right) \quad \textbf{(5)}$$

Conventions and Abbreviations

This section contains information about the conventions and abbreviations used in this document.

Signals and Bits

- Active-Low Signals—Signal names containing a pound sign, such as SFILL#, indicate active-Low signals. They are asserted in their Low-voltage state and negated in their High-voltage state. When used in this context, High and Low are written with an initial upper case letter.
- Signal Ranges—In a range of signals, the highest and lowest signal numbers are contained in brackets and separated by a colon (for example, D[63:0]).
- Reserved Bits and Signals—Signals or bus bits marked *reserved* must be driven inactive or left unconnected, as indicated in the signal descriptions. These bits and signals are reserved by AMD for future implementations. When software reads registers with reserved bits, the reserved bits must be masked. When software writes such registers, it must first read the register and change only the non-reserved bits before writing back to the register.
- Three-State—In timing diagrams, signal ranges that are high impedance are shown as a straight horizontal line half-way between the high and low levels.

- Invalid and Don’t-Care—In timing diagrams, signal ranges that are invalid or don't-care are filled with a screen pattern.

Data Terminology

The following list defines data terminology:

- Quantities
  - A *word* is two bytes (16 bits)
  - A *doubleword* is four bytes (32 bits)
  - A *quadword* is eight bytes (64 bits)
- Addressing—Memory is addressed as a series of bytes on eight-byte (64-bit) boundaries in which each byte can be separately enabled.
- Abbreviations—The following notation is used for bits and bytes:
  - Kilo (K, as in 4-Kbyte page)
  - Mega (M, as in 4 Mbits/sec)
  - Giga (G, as in 4 Gbytes of memory space)

  See Table 31 on page 89 for more abbreviations.
- Little-Endian Convention—The byte with the address xx...xx00 is in the least-significant byte position (little end). In byte diagrams, bit positions are numbered from right to left—the little end is on the right and the big end is on the left. Data structure diagrams in memory show low addresses at the bottom and high addresses at the top. When data items are aligned, bit notation on a 64-bit data bus maps directly to bit notation in 64-bit-wide memory. Because byte addresses increase from right to left, strings appear in reverse order when illustrated.
- Bit Ranges—In text, bit ranges are shown with a dash (for example, bits 9–1). When accompanied by a signal or bus name, the highest and lowest bit numbers are contained in brackets and separated by a colon (for example, AD[31:0]).
- Bit Values—Bits can either be set to 1 or cleared to 0.
- Hexadecimal and Binary Numbers—Unless the context makes interpretation clear, hexadecimal numbers are followed by an h and binary numbers are followed by a b.
