

BQ25713/B I²C Narrow VDC Buck-Boost Battery Charge Controller With System Power Monitor and Processor Hot Monitor

1 Features

- Pin-to-Pin And Software Compatible to BQ25703A
- Charge 1s to 4s Battery From Wide Range of Input Source
 - 3.5-V to 24-V Input Operating Voltage
 - Supports USB2.0, USB 3.0, USB 3.1 (Type C), and USB Power Delivery (USB-PD) Input Current Settings
 - Seamless Transition Among Buck, Buck-Boost and Boost Operations
 - Input Current and Voltage Regulation (IDPM and VDPM) Against Source Overload
- Power/Current Monitor for CPU Throttling
 - Comprehensive **PROCHOT** Profile, IMVP8/IMVP9 Compliant
 - Input and Battery Current Monitor
 - System Power Monitor, IMVP8/IMVP9 Compliant
- Narrow-VDC (NVDC) Power Path Management
 - Instant-On With No Battery or Depleted Battery
 - Battery Supplements System When Adapter is Fully-Loaded
 - Battery MOSFET Ideal Diode Operation in Supplement Mode
- Power Up USB Port From Battery (USB OTG)
 - 3-V to 20.8-V VOTG With 8 mV Resolution
 - Output Current Limit up to 6.4 A with 50 mA Resolution
- Pass Through Mode (PTM) for System Power Efficiency Improvement
- When System is Powered by Battery Only, Vmin Active Protection (VAP) Mode Supplements Battery From Input Capacitors During System Peak Power Spike
- Input Current Optimizer (ICO) to Extract Max Input Power
- 800-kHz or 1.2-MHz Programmable Switching Frequency for 2.2-μH or 1.0-μH Inductor
- Host Control Interface for Flexible System Configuration
 - I²C (BQ25713/BQ25713B) Port Optimal System Performance and Status Reporting
 - Hardware Pin to Set Input Current Limit Without EC Control

- Integrated ADC to Monitor Voltage, Current and Power
- High Accuracy for the Regulation and Monitor
 - ±0.5% Charge Voltage Regulation
 - ±2% Input/Charge Current Regulation
 - ±2% Input/Charge Current Monitor
 - ±4% Power Monitor
- Safety
 - Thermal Shutdown
 - Input, System, Battery Overvoltage Protection
 - Input, MOSFET, Inductor Overcurrent Protection
- Low Battery Quiescent Current
- Package: 32-Pin 4 × 4 WQFN

2 Applications

- Drones, Bluetooth Speakers, IP Cameras, Detachable, Tablet PCs and Power Bank
- Industrial and Medical Equipment
- Portable Equipment With Rechargeable Batteries

3 Description

This device is a synchronous NVDC buck-boost battery charge controller, offering a low component count, high efficiency solution for space constrained, 1s-4s battery charging applications.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
BQ25713 BQ25713B	WQFN (32)	4.00 mm × 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

Changes from Original (June 2018) to Revision A	Page
• Changed BQ25713 from Advance Information to Production Data and added BQ25713B	1

5 Description (continued)

The NVDC configuration allows the system to be regulated at battery voltage, but not drop below system minimum voltage. The system keeps operating even when the battery is completely discharged or removed. When load power exceeds input source rating, the battery goes into supplement mode and prevents the system from crashing.

BQ25713/BQ25713B charges battery from a wide range of input sources including USB adapter, high voltage USB PD sources and traditional adapters.

During power up, the charger sets converter to buck, boost or buck-boost configuration based on input source and battery conditions. The charger automatically transits among buck, boost and buck-boost configuration without host control.

In the absence of an input source, BQ25713/BQ25713B supports USB On-the-Go (OTG) function from 1- to 4-cell battery to generate adjustable 3 V to 20.8 V on VBUS with 8 mV resolution. The OTG output voltage transition slew rate can be configurable, which is complied with the USB PD 3.0 PPS specifications.

When only battery powers the system and no external load is connected to the USB OTG port, BQ25713/BQ25713B supports the Vmin Active Protection (VAP) feature, in which the device charges up the VBUS voltage from the battery to store some energy in the input decoupling capacitors. During the system peak power spike, the huge current drawing from the battery creates a larger voltage drop across the impedance from the battery to the system. The energy stored in the input capacitors will supplement the system, to prevent the system voltage from dropping below the minimum system voltage and causing the system crash. This Vmin Active Protection (VAP) is designed to absorb system power peaks during periods of SOC high power demand, which is highly recommended by Intel for the platforms with 1S–2S battery.

BQ25713/BQ25713B monitors adapter current, battery current and system power. The flexibly programmed PROCHOT output goes directly to CPU for throttle back when needed.

BQ25713, BQ25713B

7 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NUMBER		
ACN	2	PWR	Input current sense resistor negative input. The leakage on ACP and ACN are matched. A R-C low-pass filter is required to be placed between the sense resistor and the ACN pin to suppress the high frequency noise in the input current signal. Refer to Application and Implementation for ACP/ACN filter design.
ACP	3	PWR	Input current sense resistor positive input. The leakage on ACP and ACN are matched. A R-C low-pass filter is required to be placed between the sense resistor and the ACP pin to suppress the high frequency noise in the input current signal. Refer to Application and Implementation for ACP/ACN filter design.
$\overline{\text{BATDRV}}$	21	O	P-channel battery FET (BATFET) gate driver output. It is shorted to VSYS to turn off the BATFET. It goes 10 V below VSYS to fully turn on BATFET. BATFET is in linear mode to regulate VSYS at minimum system voltage when battery is depleted. BATFET is fully on during fast charge and works as an ideal-diode in supplement mode.
BTST1	30	PWR	Buck mode high side power MOSFET driver power supply. Connect a 0.047- μF capacitor between SW1 and BTST1. The bootstrap diode between REGN and BTST1 is integrated.
BTST2	25	PWR	Boost mode high side power MOSFET driver power supply. Connect a 0.047- μF capacitor between SW2 and BTST2. The bootstrap diode between REGN and BTST2 is integrated.
CELL_BATPRESZ	18	I	Battery cell selection pin for 1–4 cell battery setting. CELL_BATPRESZ pin is biased from VDDA. CELL_BATPRESZ pin also sets SYSOVP thresholds to 5 V for 1-cell, 12 V for 2-cell, and 19.5 V for 3-cell/4-cell. CELL_BATPRESZ pin is pulled below $V_{\text{CELL_BATPRESZ_FALL}}$ to indicate battery removal. The device exits LEARN mode, and disables charge. The charge voltage register REG0x05/04() goes back to default.

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NUMBER		
CHRG_OK	4	O	Open drain active high indicator to inform the system good power source is connected to the charger input. Connect to the pullup rail via 10-kΩ resistor. When VBUS rises above 3.5V or falls below 24.5V, CHRG_OK is HIGH after 50ms deglitch time. When VBUS falls below 3.2 V or rises above 26 V, CHRG_OK is LOW. When any fault occurs, CHRG_OK is asserted LOW.
CMPIN	14	I	Input of independent comparator. The independent comparator compares the voltage sensed on CMPIN pin with internal reference, and its output is on CMPOUT pin. Internal reference, output polarity and deglitch time is selectable by the I ² C host. With polarity HIGH (REG0x30[6] = 1), place a resistor between CMPIN and CMPOUT to program hysteresis. With polarity LOW (REG0x30[6] = 0), the internal hysteresis is 100 mV. If the independent comparator is not in use, tie CMPIN to ground.
CMPOUT	15	O	Open-drain output of independent comparator. Place pullup resistor from CMPOUT to pullup supply rail. Internal reference, output polarity and deglitch time are selectable by the I ² C host.
COMP2	17	I	Buck boost converter compensation pin 2. Refer to BQ2571X EVM schematic for COMP2 pin RC network.
COMP1	16	I	Buck boost converter compensation pin 1. Refer to BQ2571X EVM schematic for COMP1 pin RC network.
OTG/VAP	5	I	Active HIGH to enable OTG or VAP modes. When REG0x34[5]=1, pulling high OTG/VAP pin and setting REG0x35[4]=1 can enable OTG mode. When REG0x34[5]=0, pulling high OTG/VAP pin is to enable VAP mode.
HIDRV1	31	O	Buck mode high side power MOSFET (Q1) driver. Connect to high side n-channel MOSFET gate.
HIDRV2	24	O	Boost mode high side power MOSFET(Q4) driver. Connect to high side n-channel MOSFET gate.
IADPT	8	O	The adapter current monitoring output pin. $V_{(IADPT)} = 20 \text{ or } 40 \times (V_{(ACP)} - V_{(ACN)})$ with ratio selectable in REG0x00[4]. Place a resistor from the IADPT pin to ground corresponding to the inductance in use. For a 2.2 μH inductance, the resistor is 137 kΩ. Place a 100-pF or less ceramic decoupling capacitor from IADPT pin to ground. IADPT output voltage is clamped below 3.3 V.
IBAT	9	O	The battery current monitoring output pin. $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRP)} - V_{(SRN)})$ for charge current, or $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRN)} - V_{(SRP)})$ for discharge current, with ratio selectable in REG0x00[3]. Place a 100-pF or less ceramic decoupling capacitor from IBAT pin to ground. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V.
ILIM_HIZ	6	I	Input current limit setting pin. Program ILIM_HIZ voltage by connecting a resistor divider from supply rail to ILIM_HIZ pin to ground. The pin voltage is calculated as: $V_{(ILIM_HIZ)} = 1 \text{ V} + 40 \times \text{IDPM} \times \text{RAC}$, in which IDPM is the target input current. The input current limit used by the charger is the lower setting of ILIM_HIZ pin and REG0x0F/0E(). When the pin voltage is below 0.4 V, the device enters Hi-Z mode with low quiescent current. When the pin voltage is above 0.8 V, the device is out of Hi-Z mode.
LODRV1	29	O	Buck mode low side power MOSFET (Q2) driver. Connect to low side n-channel MOSFET gate.
LODRV2	26	O	Boost mode low side power MOSFET (Q3) driver. Connect to low side n-channel MOSFET gate.
PGND	27	GND	Device power ground.
PROCHOT	11	O	Active low open drain output of processor hot indicator. It monitors adapter input current, battery discharge current, and system voltage. After any event in the PROCHOT profile is triggered, a pulse is asserted. The minimum pulse width is adjustable in REG0x23[6:3].
PSYS	10	O	Current mode system power monitor. The output current is proportional to the total power from the adapter and the battery. The gain is selectable through I ² C. Place a resistor from PSYS to ground to generate output voltage. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V. Place a capacitor in parallel with the resistor for filtering.
REGN	28	PWR	6-V linear regulator output supplied from VBUS or VSYS. The LDO is active when VBUS above V_{VBUS_CONVEN} . Connect a 2.2- or 3.3-μF ceramic capacitor from REGN to power ground. REGN pin output is for power stage gate drive.
SCL	13	I	I ² C clock input. Connect to clock line from the host controller or smart battery. Connect a 10-kΩ pullup resistor according to I ² C specifications.
SDA	12	I/O	I ² C open-drain data I/O. Connect to data line from the host controller or smart battery. Connect a 10-kΩ pullup resistor according to I ² C specifications.

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NUMBER		
SRN	19	PWR	Charge current sense resistor negative input. SRN pin is for battery voltage sensing as well. Connect SRN pin with optional 0.1- μ F ceramic capacitor to GND for common-mode filtering. Connect a 0.1- μ F ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are matched.
SRP	20	PWR	Charge current sense resistor positive input. Connect SRP pin with optional 0.1- μ F ceramic capacitor to GND for common-mode filtering. Connect a 0.1- μ F ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are matched.
SW1	32	PWR	Buck mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.
SW2	23	PWR	Boost mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.
VBUS	1	PWR	Charger input voltage. An input low pass filter of 1 Ω and 0.47 μ F (minimum) is recommended.
VDDA	7	PWR	Internal reference bias pin. Connect a 10- Ω resistor from REGN to VDDA and a 1- μ F ceramic capacitor from VDDA to power ground.
VSYS	22	PWR	Charger system voltage sensing. The system voltage regulation limit is programmed in REG0x05/04() and REG0x0D/0C().
Thermal pad	–	–	Exposed pad beneath the IC. Always solder thermal pad to the board, and have vias on the thermal pad plane connecting to power ground planes. It serves as a thermal pad to dissipate the heat.

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
Voltage	SRN, SRP, ACN, ACP, VBUS, VSYS	–0.3	30	V
	SW1, SW2	–2	30	
	BTST1, BTST2, HIDRV1, HIDRV2, /BATDRV	–0.3	36	
	LODRV1, LODRV2 (25nS)	–4	7	
	HIDRV1, HIDRV2 (25nS)	–4	36	
	SW1, SW2 (25nS)	–4	30	
	SDA, SCL, REGN, PSYS, CHRG_OK, OTG/VAP CELL_BATPRESZ, ILIM_HIZ, LODRV1, LODRV2, VDDA, COMP1, COMP2, CMPIN, CMPOUT	–0.3	7	
	/PROCHOT	–0.3	5.5	
	IADPT, IBAT, PSYS	–0.3	3.6	
Differential Voltage	BTST1-SW1, BTST2-SW2, HIDRV1-SW1, HIDRV2-SW2	–0.3	7	V
	SRP-SRN, ACP-ACN	–0.5	0.5	
Temperature	Junction temperature range, T _J	–40	155	°C
	Storage temperature, T _{stg}	–40	155	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to GND if not specified. Currents are positive into, negative out of the specified terminal. Consult Packaging Section of the data book for thermal limitations and considerations of packages.

8.2 ESD Ratings

		VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, allpins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specificationJESD22-C101, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Voltage	ACN, ACP, VBUS	0	24	V
	SRN, SRP, VSYS	0	19.2	
	SW1, SW2	–2	24	
	BTST1, BTST2, HIDRV1, HIDRV2, /BATDRV	0	30	
	SDA, SCL, REGN, PSYS, CHRG_OK, CELL_BATPRESZ, ILIM_HIZ, LODRV1, LODRV2, VDDA, COMP1, COMP2, CMPIN, CMPOUT	0	6.5	
	/PROCHOT	0	5.3	
	IADPT, IBAT, PSYS	0	3.3	
Differential Voltage	BTST1-SW1, BTST2-SW2, HIDRV1-SW1, HIDRV2-SW2	0	6.5	V
	SRP-SRN, ACP-ACN	–0.5	0.5	
Junction temperature range, T _J		–20	125	°C
Operating free-air temperature range, T _J		–40	85	°C

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		BQ25713/BQ25713B	UNIT
		RSN (WQFN)	
		32 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	37.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	26.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.8	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.3	°C/W
Y_{JB}	Junction-to-board characterization parameter	7.8	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.3	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

8.5 Electrical Characteristics

8.6 Timing Requirements

	MIN	NOM	MAX	UNIT
I2C TIMING CHARACTERISTICS				
t_r SCLK/SDATA rise time			1	μs
t_f SCLK/SDATA fall time			300	ns
$t_{W(H)}$ SCLK pulse width high	4		50	μs
$t_{W(L)}$ SCLK Pulse Width Low	4.7			μs

Timing Requirements (continued)

		MIN	NOM	MAX	UNIT
$t_{SU(STA)}$	Setup time for START condition	4.7			μs
$t_{H(STA)}$	START condition hold time after which first clock pulse is generated	4			μs
$t_{SU(DAT)}$	Data setup time	250			ns
$t_{H(DAT)}$	Data hold time	300			ns
$t_{SU(STOP)}$	Setup time for STOP condition	4			μs
$t_{(BUF)}$	Bus free time between START and STOP condition	4.7			μs
$F_{S(CL)}$	Clock Frequency	10		100	kHz
HOST COMMUNICATION FAILURE					
$t_{timeout}$	I2C bus release timeout ⁽¹⁾	25		35	ms
t_{Deg_WD}	Deglintch for watchdog reset signal	10			ms
t_{WDI}	Watchdog timeout period, ChargeOption() bit [14:13] = 01 ⁽²⁾	4	5.5	7	s
	Watchdog timeout period, ChargeOption() bit [14:13] = 10 ⁽²⁾	70	88	105	s
	Watchdog timeout period, ChargeOption() bit [14:13] = 11 ⁽²⁾	140	175	210	s

- (1) Devices participating in a transfer will timeout when any clock low exceeds the 25ms minimum timeout period. Devices that have detected a timeout condition must reset the communication no later than the 35 ms maximum timeout period. Both a master and a slave must adhere to the maximum value specified as it incorporates the cumulative stretch limit for both a master (10 ms) and a slave (25 ms).
- (2) User can adjust threshold via I2C ChargeOption() REG0x01/00().

9 Detailed Description

9.1 Overview

The BQ25713/BQ25713B is a Narrow VDC buck-boost charger controller for portable electronics such as notebook, detachable, ultrabook, tablet and other mobile devices with rechargeable batteries. It provides seamless transition among different converter operation modes (buck, boost, or buck boost), fast transient response, and high light load efficiency.

BQ25713/BQ25713B supports wide range of power sources, including USB PD ports, legacy USB ports, traditional ACDC adapters, etc. It takes input voltage from 3.5 V to 24 V, and charges battery of 1-4 series. In the absence of an input source, BQ25713/BQ25713B supports USB On-the-Go (OTG) function from 1-4 cell battery to generate adjustable 3 V ~ 20.8 V at USB port with 8mV resolution. The OTG output voltage transition slew rate can be configurable, which complies with the USB Power Delivery 3.0 PPS specifications.

When only the battery powers the system and no external load is connected to the USB OTG port, BQ25713/BQ25713B provides the Vmin Active Protection (VAP) feature. In the VAP operation, BQ25713/BQ25713B first charges up the voltage of the input decoupling capacitors at VBUS to store a certain amount of energy. During the system peak power spike, the huge current drawn from the battery introduces a larger voltage drop across the impedance from the battery to the system. Then the energy stored in the input capacitors will supplement the system, to prevent the system voltage from drooping below the minimum system voltage and leading the system to black screen. This VAP is designed to absorb system power peaks during the periods of high demand to improve the system turbo performance, which is highly recommended by Intel for the platforms with 1S~2S battery.

BQ25713/BQ25713B features Dynamic Power Management (DPM) to limit the input power and avoid AC adapter overloading. During battery charging, as the system power increases, the charging current will reduce to maintain total input current below adapter rating. If system power demand temporarily exceeds adapter rating, BQ25713/BQ25713B supports NVDC architecture to allow battery discharge energy to supplement system power. For details, refer to [System Voltage Regulation](#) section.

In order to be compliant with an Intel IMVP8 / IMVP9 compliant system, BQ25713/BQ25713B includes PSYS function to monitor the total platform power from adapter and battery. Besides PSYS, it provides both an independent input current buffer (IADPT) and a battery current buffer (IBAT) with highly accurate current sense amplifiers. If the platform power exceeds the available power from adapter and battery, a PROCHOT signal is asserted to CPU so that the CPU optimizes its performance to the power available to the system.

The I²C controls input current, charge current and charge voltage registers with high resolution, high accuracy regulation limits. It also sets the PROCHOT timing and threshold profile to meet system requirements.

BQ25713, BQ25713B

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Power-Up from Battery Without DC Source

If only battery is present and the voltage is above V_{VBAT_UVLOZ} , the BATFET turns on and connects battery to system. By default, the charger is in low power mode ($REG0x01[7] = 1$) with lowest quiescent current. The LDO stays off. When device moves to performance mode ($REG0x01[7] = 0$), The host can enable IBAT buffer through I²C to monitor discharge current. The PSYS, $\overline{PROCHOT}$ or independent comparator also can be enabled by the host through the I²C commands. In performance mode, the REGN LDO is always available to provide an accurate reference for the other features.

9.3.2 Vmin Active Protection (VAP) when Battery only Mode

In VAP mode operation, the buck-boost charger delivers the energy from the battery to charge the voltage of the input decoupling capacitors (VBUS) as high as possible (like 20V). The system peak power pulse for a 2S1P or 1S2P system can be as high as 100W if the SoC and motherboard systems spikes coincide. These spikes are expected to be very rare, but possible. During these high power spikes, the charger is expected to supplement the battery (drawing the power from the charger's input decoupling capacitors) to prevent the system voltage from drooping. VAP allows the SoC to set much higher peak power levels to the SoC, thus provides for much better Turbo performance.

Follows the steps below to enter VAP operation.:

1. Set the voltage limit to charge VBUS in $REG0x07/06()$.
2. Set the current limit to charge VBUS in $REG0x09/08()$ and $REG0x39[7:2]$.
3. Set the system voltage regulation point in $REG0x0D[5:0]$, when the input cap supplements battery, the VSYS_MIN regulation loop will maintain VSYS at this regulation point.
4. Set the $\overline{PROCHOT_VSYS_TH1}$ threshold to trigger the VAP discharging VBUS in $REG0x36[7:4]$.
5. Set the $\overline{PROCHOT_VSYS_TH2}$ threshold to assert $\overline{PROCHOT}$ active low signal to throttle SoC in $REG0x36[3:2]$.
6. Enable the VAP mode by setting $REG0x34[5] = 0$, $REG0x35[4] = 0$, and pulling the OTG/VAP pin to high.

To exit VAP mode, the host should write either $REG0x34[5] = 1$ or pull low the OTG/VAP to low.

Any regular fault conditions of the charger in VAP mode will reset $REG0x34[5] = 1$, and the charger will exit VAP mode automatically.

9.3.3 Power-Up From DC Source

When an input source plugs in, the charger checks the input source voltage to turn on LDO and all the bias circuits. It sets the input current limit before the converter starts.

The power-up sequence from DC source is as follows:

1. 50 ms after VBUS above V_{VBUS_CONVEN} , enable 6 V LDO and CHRG_OK goes HIGH
2. Input voltage and current limit setup
3. Battery CELL configuration
4. 150 ms after VBUS above V_{VBUS_CONVEN} , converter powers up.

9.3.3.1 CHRG_OK Indicator

CHRG_OK is an active HIGH open drain indicator. It indicates the charger is in normal operation when the following conditions are valid:

- VBUS is above V_{VBUS_CONVEN}
- VBUS is below V_{ACOV}
- No MOSFET/inductor, or over-voltage, over-current, thermal shutdown fault

9.3.3.2 Input Voltage and Current Limit Setup

After CHRG_OK goes HIGH, the charger sets default input current limit in $REG0x0F/0E()$ to 3.30 A. The actual input current limit being adopted by the device is the lower setting of $REG0x0F/0E()$ and ILIM_HIZ pin.

Feature Description (continued)

Charger initiates a VBUS voltage measurement without any load (VBUS at no load) right before the converter is enabled. The default VINDPM threshold is VBUS at no load – 1.28 V.

After input current and voltage limits are set, the charger device is ready to power up. The host can always program the input current and voltage limit after the charger being powered up, based on the input source type.

9.3.3.3 Battery Cell Configuration

CELL_BATPRESZ pin is biased with a resistor divider from REGN to CELL_BATPRESZ to GND. After VDDA LDO is activated, the device detects the battery configuration through CELL_BATPRESZ pin bias voltage. Refer to [Table 1](#) for cell setting thresholds.

Table 1. Battery Cell Configuration

CELL COUNT	PIN VOLTAGE w.r.t. VDDA	BATTERY VOLTAGE (REG0x05/04)	SYSOVP
4S	75%	16.800 V	19.5 V
3S	55%	12.592 V	19.5 V
2S	40%	8.400 V	12 V
1S	25%	4.192 V	5 V

9.3.3.4 Device Hi-Z State

The charger enters Hi-Z mode when ILIM_HIZ pin voltage is below 0.4 V or REG0x35[7] is set to 1. During Hi-Z mode, the input source is present, and the charger is in the low quiescent current mode with REGN LDO enabled.

9.3.4 USB On-The-Go (OTG)

The device supports USB OTG operation to deliver power from the battery to other portable devices through USB port. The OTG mode output voltage is set in REG0x07/06(). The OTG mode output current is set in REG0x09/08(). The OTG operation can be enabled if the conditions are valid:

- Valid battery voltage is set REG0x05/04(), the battery voltage should not trip the BATOVPP threshold, otherwise, the converter will stop switching.
- OTG output voltage is set in REG0x07/06() and REG0x34[2], if REG0x34[2] = 0, the VOTG digital DAC is offset by 1.28V to achieve higher range from 4.28V~20.8V, if REG0x34[2] = 1, the VOTG digital DAC is from 3V to 19.52V.
- OTG output current is set in REG0x09/08().
- EN_OTG pin is HIGH, REG0x35[4] = 1 and REG0x34[5] = 1.
- VBUS is below V_{VBUS_UVLO} .
- 10 ms after the above conditions are valid, converter starts and VBUS ramps up to target voltage. CHRQ_OK pin goes HIGH if REG0x01[3] = 1.

9.3.5 Converter Operation

The charger employs a synchronous buck-boost converter that allows charging from a standard 5-V or a high-voltage power source. The charger operates in buck, buck-boost and boost mode. The buck-boost can operate uninterruptedly and continuously across the three operation modes.

Table 2. MOSFET Operation

MODE	BUCK	BUCK-BOOST	BOOST
Q1	Switching	Switching	ON
Q2	Switching	Switching	OFF
Q3	OFF	Switching	Switching
Q4	ON	Switching	Switching

9.3.5.1 Inductance Detection through IADPT Pin

The charger reads the inductance value through the resistance tied to IADPT pin before the converter starts up. The resistances recommended for 1μH, 2.2μH and 3.3μH inductance are 93kΩ, 137kΩ and 169kΩ, respectively. A surface mount chip resistor with ±3% or better tolerance must to be used for an accurate inductance detection.

Table 3. Inductor Detection through IADPT Resistance

INDUCTOR IN USE	RESISTOR ON IADPT PIN
1 μH	93 kΩ
2.2 μH	137 kΩ
3.3 μH	169 kΩ

9.3.5.2 Continuous Conduction Mode (CCM)

With sufficient charge or system current, the inductor current does not cross 0 A, which is defined as CCM. The controller starts a new cycle with ramp coming up from 200 mV. As long as the error amplifier output voltage is above the ramp voltage, the high-side MOSFET (HSFET) stays on. When the ramp voltage exceeds error amplifier output voltage, HSFET turns off and low-side MOSFET (LSFET) turns on. At the end of the cycle, ramp gets reset and LSFET turns off, ready for the next cycle. There is always break-before-make logic during transition to prevent cross-conduction and shoot-through. During the dead time when both MOSFETs are off, the body-diode of the low-side power MOSFET conducts the inductor current.

During CCM, the inductor current always flows and creates a fixed two-pole system. Having the LSFET turn-on when the HSFET is off keeps the power dissipation low and allows safe charging at high currents.

9.3.5.3 Pulse Frequency Modulation (PFM)

In order to improve converter light-load efficiency, BQ25713/BQ25713B switches to PFM operation at light load. The effective switching frequency will decrease accordingly when system load decreases. The minimum frequency can be limit to 25 kHz when the OOA feature is enabled (ChargeOption0() bit[10]=1).

9.3.6 Current and Power Monitor

9.3.6.1 High-Accuracy Current Sense Amplifier (IADPT and IBAT)

As an industry standard, a high-accuracy current sense amplifier (CSA) is used to monitor the input current during forward charging, or output current during OTG (IADPT) and the charge/discharge current (IBAT). IADPT voltage is 20× or 40× the differential voltage across ACP and ACN. IBAT voltage is 8×/16× (during charging), or 8×/16× (during discharging) of the differential across SRP and SRN. After input voltage or battery voltage is above UVLO, IADPT output becomes valid. To lower the voltage on current monitoring, a resistor divider from CSA output to GND can be used and accuracy over temperature can still be achieved.

- $V_{(IADPT)} = 20 \text{ or } 40 \times (V_{(ACP)} - V_{(ACN)})$ during forward mode, or $20 \text{ or } 40 \times (V_{(ACN)} - V_{(ACP)})$ during reverse OTG mode.
- $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRP)} - V_{(SRN)})$ during forward mode.
- $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRN)} - V_{(SRP)})$ during forward supplement mode, or reverse OTG mode.

A maximum 100-pF capacitor is recommended to connect on the output for decoupling high-frequency noise. An additional RC filter is optional, if additional filtering is desired. Note that adding filtering also adds additional response delay. The CSA output voltage is clamped at 3.3 V.

9.3.6.2 High-Accuracy Power Sense Amplifier (PSYS)

The charger monitors total system power. During forward mode, the input adapter powers system. During reverse OTG mode, the battery powers the system and VBUS output. The ratio of PSYS pin output current and total system power, K_{PSYS} , can be programmed in REG0x31[1] with default 1 μA/W. The input and charge sense resistors (RAC and RSR) are selected in REG0x31[3:2]. PSYS voltage can be calculated with Equation 1, where $I_{IN} > 0$ $I_{BAT} < 0$ when the charger is in forward charging with an adapter connected, and $I_{BAT} > 0$ when the battery is in discharging mode.

$$V_{PSYS} = R_{PSYS} \times K_{PSYS} (V_{ACP} \times I_{IN} + V_{BAT} \times I_{BAT}) \quad (1)$$

For proper PSYS functionality, RAC and RSR values are limited to 10 mΩ and 20 mΩ.

To minimize the quiescent current, the PSYS function is disabled by default. It can be enabled by setting $\text{REG0x31}[4] = 1$.

9.3.7 Input Source Dynamic Power Manage

Refer to [Input Current and Input Voltage Registers for Dynamic Power Management](#).

9.3.8 Two-Level Adapter Current Limit (Peak Power Mode)

Usually adapter can supply current higher than DC rating for a few milliseconds to tens of milliseconds. The charger employs two-level input current limit, or peak power mode, to fully utilize the overloading capability and minimize battery discharge during CPU turbo mode. Peak power mode is enabled in $\text{REG0x33}[5:4]$. The DC current limit, or I_{LIM1} , is the same as adapter DC current, set in $\text{REG0x0F}/0\text{E}()$. The overloading current, or I_{LIM2} , is set in $\text{REG0x37}[7:3]$, as a percentage of I_{LIM1} .

When the charger detects input current surge and battery discharge due to load transient (both the adapter and battery support the system together), or when the charger detects the system voltage starts to drop due to load transient (only the adapter supports the system), the charger will first apply I_{LIM2} for $T_{\text{OVL D}}$ in $\text{REG0x33}[7:6]$, and then I_{LIM1} for up to $T_{\text{MAX}} - T_{\text{OVL D}}$ time. T_{MAX} is programmed in $\text{REG0x33}[1:0]$. After T_{MAX} , if the load is still high, another peak power cycle starts. Charging is disabled during T_{MAX} ; once T_{MAX} expires, charging continues. If $T_{\text{OVL D}}$ is programmed to be equal to T_{MAX} , then peak power mode is always on.

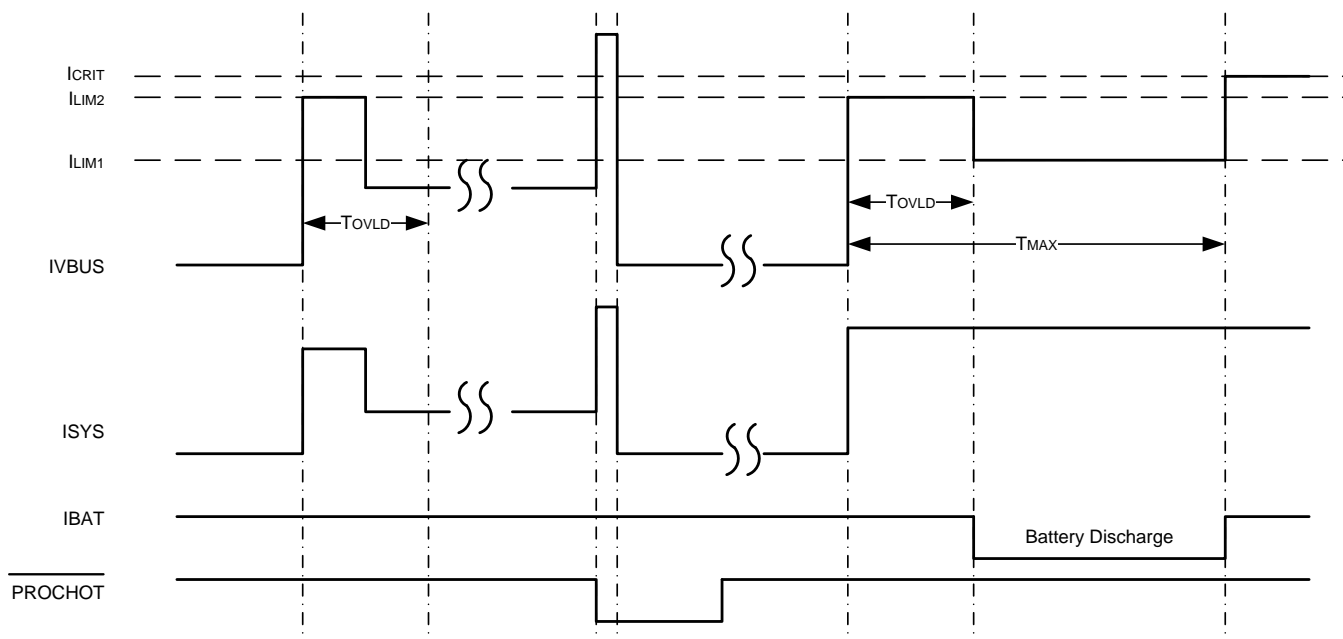

Figure 12. Two-Level Adapter Current Limit Timing Diagram

9.3.9 Processor Hot Indication

When CPU is running turbo mode, the system peak power may exceed available power from adapter and battery together. The adapter current and battery discharge peak current, or system voltage drop is an indication that system power is too high. The charger processor hot function monitors these events, and $\overline{\text{PROCHOT}}$ pulse is asserted if the system power is too high. Once CPU receives $\overline{\text{PROCHOT}}$ pulse from charger, it slows down to reduce system power. The events monitored by the processor hot function includes:

- ICRIT: adapter peak current, as 110% of I_{LIM2}
- INOM: adapter average current (110% of input current limit)
- IDCHG: battery discharge current
- VSYS: system voltage on VSYS
- Adapter Removal: upon adapter removal (CHRG_OK pin HIGH to LOW)
- Battery Removal: upon battery removal (CELL_BATPRESZ pin goes LOW)
- CMPOUT: Independent comparator output (CMPOUT pin HIGH to LOW)

- VDPM: VBUS lower than 80%/90%/100% of VINDPM threshold.
- EXIT_VAP: Every time when the charger exits VAP mode.

The threshold of ICRIT, IDCHG, VSYS or VDPM, and the deglitch time of ICRIT, INOM, IDCHG or CMPOUT are programmable through I²C. Except the PROCHOT_EXIT_VAP is always enabled, the other triggering events can be individually enabled in REG0x38[7:0]. When any enabled event in PROCHOT profile is triggered, PROCHOT is asserted low for a single pulse with minimal width programmable in REG0x23[5:4]. At the end of the single pulse, if the PROCHOT event is still active, the pulse gets extended until the event is removed.

If the PROCHOT pulse extension mode is enabled by setting REG0x23[6] = 1, the PROCHOT pin will be kept as low until host writes REG0x23[3]21[11] = 0, even if the triggering event has been removed.

If the PROCHOT_VDPM or PROCHOT_EXIT_VAP is triggered, PROCHOT pin will always stay low until the host clears it, no matter the PROCHOT is in one pulse mod or in extended mode.

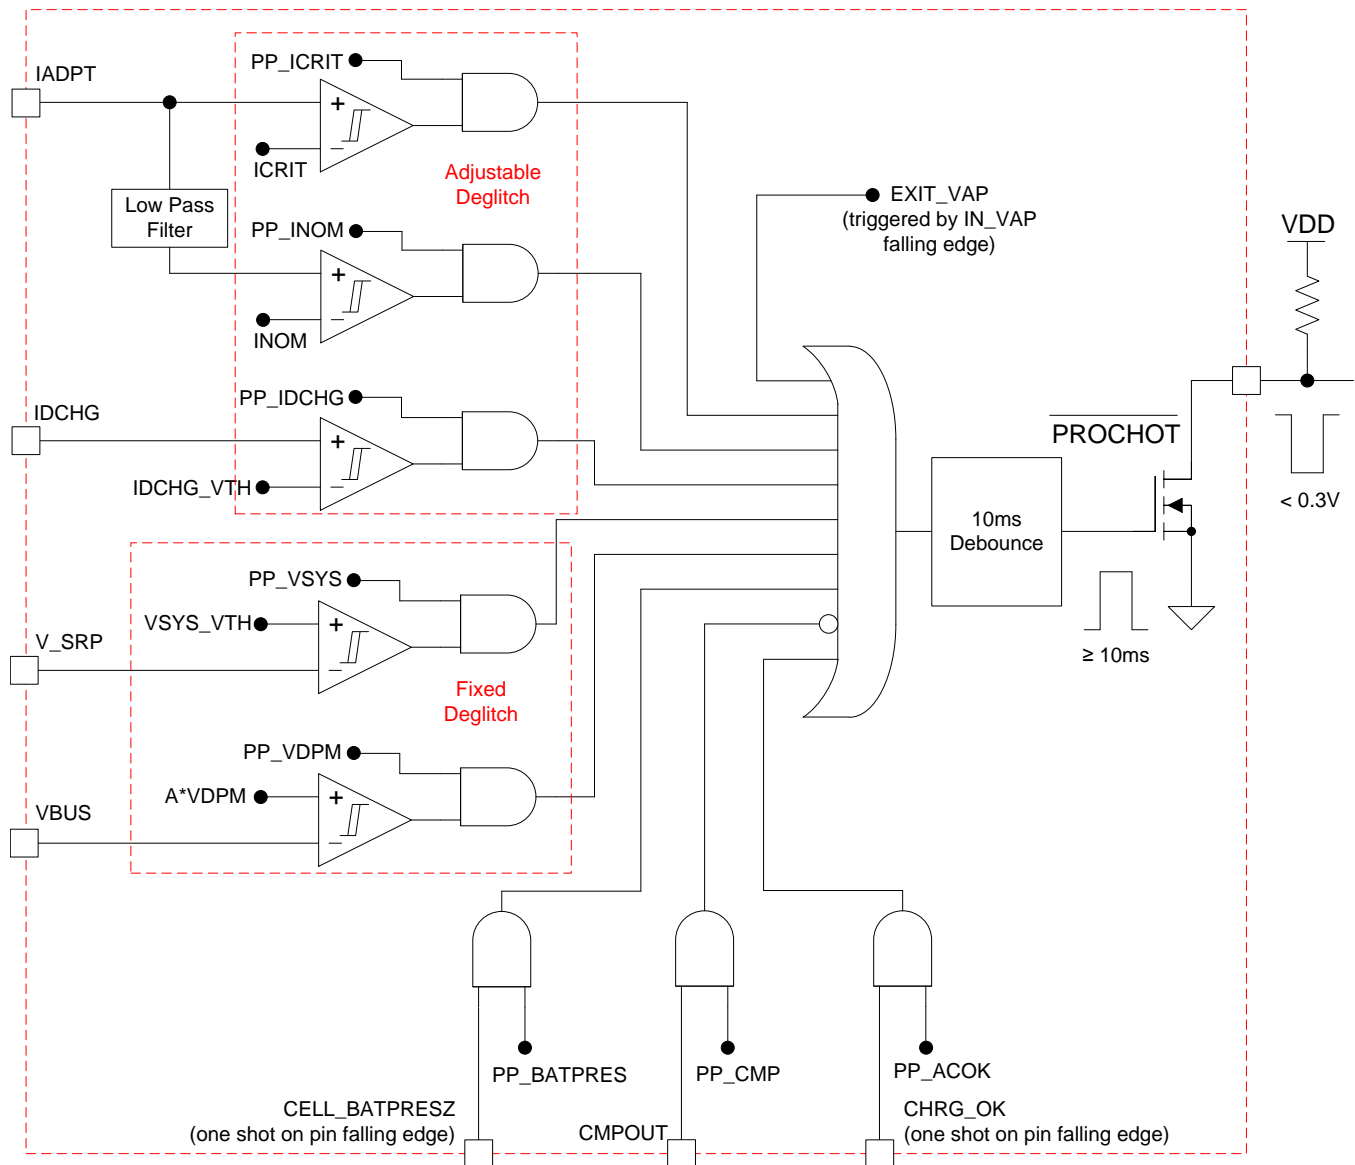

Figure 13. PROCHOT Profile

9.3.9.1 PROCHOT During Low Power Mode

During low power mode ($\text{REG0x01}[7] = 1$), the charger offers a low power PROCHOT function with very low quiescent current consumption ($\sim 150\mu\text{A}$), which uses the independent comparator to monitor the system voltage, and assert PROCHOT to CPU if the system power is too high.

Below lists the register setting to enable PROCHOT monitoring system voltage in low power mode.

- $\text{REG0x01}[7] = 1$ to enable charger low power mode.
- $\text{REG0x38}[7:0] = 00\text{h}$
- $\text{REG0x30}[6:4] = 100$
- Independent comparator threshold is always 1.2 V
- When $\text{REG0x31}[5] = 1$, charger monitors system voltage. Connect CMPIN to voltage proportional to system. PROCHOT triggers from HIGH to LOW when CMPIN voltage rises above 1.2 V.

Figure 14. PROCHOT Low Power Mode Implementation

9.3.9.2 PROCHOT Status

$\text{REG0x22}[7:0]$ and $\text{REG0x23}[0]$ reports which event in the profile triggers PROCHOT if the corresponding bit is set to 1. The status bit can be reset back to 0 after it is read by host, when the current PROCHOT event is not active any more.

Assume there are two PROCHOT events, event A and event B. Event A triggers PROCHOT first, but event B is also active. Both status bits will be HIGH. At the end of the 10 ms PROCHOT pulse, if any of the PROCHOT event is still active (either A or B), the PROCHOT pulse is extended.

9.3.10 Device Protection

9.3.10.1 Watchdog Timer

The charger includes watchdog timer to terminate charging if the charger does not receive a write `MaxChargeVoltage()` or write `ChargeCurrent()` command within 175 s (adjustable via $\text{REG0x01}[6:5]$). When watchdog timeout occurs, all register values are kept unchanged except `ChargeCurrent()` resets to zero. Battery charging is suspended. Write `MaxChargeVoltage()` or write `ChargeCurrent()` commands must be re-sent to reset watchdog timer and resume charging. Writing $\text{REG0x01}[6:5] = 00$ to disable watchdog timer also resumes charging.

9.3.10.2 Input Overvoltage Protection (ACOV)

The charger has fixed ACOV voltage. When VBUS pin voltage is higher than ACOV, it is considered as adapter over voltage. CHRG_OK will be pulled low, and converter will be disabled. As system falls below battery voltage, BATFET will be turned on. When VBUS pin voltage falls below ACOV, it is considered as adapter voltage returns back to normal voltage. CHRG_OK is pulled high by external pull up resistor. The converter resumes if enable conditions are valid.

9.3.10.3 Input Overcurrent Protection (ACOC)

If the input current exceeds the $1.33\times$ or $2\times$ (REG0x32[2]) of I_{LIM2_VTH} (REG0x37[7:3]) set point, converter stops switching. After 300 ms, converter starts switching again.

9.3.10.4 System Overvoltage Protection (YSOVP)

When the converter starts up, BQ25713/BQ25713B reads CELL pin configuration and sets MaxChargeVoltage() and YSOVP threshold (1s – 5 V, 2s – 12 V, 3s/4s – 19.5 V). Before REGx05/04() is written by the host, the battery configuration will change with CELL pin voltage. When YSOVP happens, the device latches off the converter. REG0x20[4] is set to 1. The user can clear latch-off by either writing 0 to the YSOVP bit or removing and plugging in the adapter again. After latch-off is cleared, the converter starts again.

9.3.10.5 Battery Overvoltage Protection (BATOVP)

Battery over-voltage may happen when battery is removed during charging or the user plugs in a wrong battery. The BATOVP threshold is 104% (1 s) or 102% (2 s to 4 s) of regulation voltage set in REG0x05/04().

9.3.10.6 Battery Short

If BAT voltage falls below SYSMIN during charging, the maximum current is limited to 384 mA.

9.3.10.7 System Short Hiccup Mode

VSYS pin is monitoring the system voltage, when Vsys is lower than 2.4V, after 2ms deglitch time, the charger will be shut down for 500ms. The charger will restart for 10ms and measure Vsys again, if it is still lower than 2.4V, the charger will be shut down again. This hiccup mode will be tried continuously, if the charger restart is failed for 7 times in 90 second, the charger will be latched off. REG0x20[3] will be set to 1 to report a system short fault. The charger only can be enabled again once the host writes REG0x00[6] = 1.

The charger system short hiccup mode can be disabled by writing

9.3.10.8 Thermal Shutdown (TSHUT)

The WQFN package has low thermal impedance, which provides good thermal conduction from the silicon to the ambient, to keep junction temperatures low. As added level of protection, the charger converter turns off for self-protection whenever the junction temperature exceeds the 155°C. The charger stays off until the junction temperature falls below 135°C. During thermal shut down, the LDO current limit is reduced to 16 mA and REGN LDO stays off. When the temperature falls below 135°C, charge can be resumed with soft start.

9.4 Device Functional Modes

9.4.1 Forward Mode

When input source is connected to VBUS, BQ25713/BQ25713B is in forward mode to regulate system and charge battery.

9.4.1.1 System Voltage Regulation with Narrow VDC Architecture

BQ25713/BQ25713B employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by MinSystemVoltage(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode).

Device Functional Modes (continued)

As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

The BATDRV pin is only able to drive a battery MOSFET with Ciss lower than 5nF. The Ciss in the range of 1nF~3nF is recommended.

See [System Voltage Regulation](#) for details on system voltage regulation and register programming.

9.4.1.2 Battery Charging

BQ25713/BQ25713B charges 1-4 cell battery in constant current (CC), and constant voltage (CV) mode. Based on CELL_BATPREZ pin setting, the charger sets default battery voltage 4.2V/cell to ChargeVoltage(), or REG0x05/04(). According to battery capacity, the host programs appropriate charge current to ChargeCurrent(), or REG0x03/02(). When battery is full or battery is not in good condition to charge, host terminates charge by setting REG0x00[0] to 1, or setting ChargeCurrent() to zero.

See [Feature Description](#) for details on register programming.

9.4.2 USB On-The-Go

BQ25713/BQ25713B supports USB OTG functionality to deliver power from the battery to other portable devices through USB port (reverse mode). The OTG output voltage is compliant with USB PD specification, including 5 V, 9 V, 15 V, and 20 V. The output current regulation is compliant with USB type C specification, including 500 mA, 1.5 A, 3 A and 5 A.

Similar to forward operation, the device switches from PWM operation to PFM operation at light load to improve efficiency.

9.4.3 Pass Through Mode (PTM)

When the system is in the sleep mode or light load condition, the charger can be operated in the pass through mode to improve the light load efficiency. In PTM, the Buck and Boost high side FETs are both turned on, while the Buck and Boost low side FETs are both turned off. The input power is directly passed through the charger to the system. The switching losses of MOSFETs and the inductor core loss are saved.

Device will be transition from normal Buck-Boost operation to PTM operation by:

- Set REG0x32[7] = 0, to disable the EN_EXITILIM.
- Set REG0x31[0] = 1.
- Set REG0x30[2] = 1.
- Ground ILIM_HIZ pin.

Device will transition out of PTM mode with host control by:

- Set REG0x30[2] = 0.
- Pull ILIM_HIZ pin to high.
- Device exits PTM to buck-boost operation if tripping VinDPM.
- Device exits PTM to buck-boost operation under fault conditions (for examples ACOC, TSHUT, BATOC, BATOV).

9.5 Programming

The charger supports battery-charger commands that use either Write-Word or Read-Word protocols, as summarized in [Section 8.5.1.1](#). The I2C address is D6h. The ManufacturerID and DeviceID registers are assigned identify the charger device. The ManufacturerID register command always returns 40h.

Programming (continued)

9.5.1 I²C Serial Interface

The BQ25713/BQ25713B uses I²C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I²C is a bi-directional 2-wire serial interface. Only two bus lines are required: a serial data line (SDA) and a serial clock line (SCL). Devices can be considered as masters or slaves when performing data transfers. A master is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

The device operates as a slave device with address D6h, receiving control inputs from the master device like micro controller or a digital signal processor through REG00-REG0F. The I²C interface supports both standard mode (up to 100 kbits), and fast mode (up to 400 kbits). connecting to the positive supply voltage via a current source or pull-up resistor. When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain.

9.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. One clock pulse is generated for each data bit transferred.

Figure 15. Bit Transfer on the I²C Bus

9.5.1.2 START and STOP Conditions

All transactions begin with a START (S) and can be terminated by a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

START and STOP conditions are always generated by the master. The bus is considered busy after the START condition, and free after the STOP condition.

Figure 16. START and STOP Conditions

9.5.1.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an Acknowledge bit. Data is transferred with the Most Significant Bit (MSB) first. If a slave cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the clock line SCL low to force the master into a wait state (clock stretching). Data transfer then continues when the slave is ready for another byte of data and release the clock line SCL.

Programming (continued)

Figure 17. Data Transfer on the I²C Bus

9.5.1.4 Acknowledge (ACK) and Not Acknowledge (NACK)

The acknowledge takes place after every byte. The acknowledge bit allows the receiver to signal the transmitter that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge 9th clock pulse, are generated by the master.

The transmitter releases the SDA line during the acknowledge clock pulse so the receiver can pull the SDA line LOW and it remains stable LOW during the HIGH period of this clock pulse.

When SDA remains HIGH during the 9th clock pulse, this is the Not Acknowledge signal. The master can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

9.5.1.5 Slave Address and Data Direction Bit

After the START, a slave address is sent. This address is 7 bits long followed by the eighth bit as a data direction bit (bit R/W). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ).

Figure 18. Complete Data Transfer

9.5.1.6 Single Read and Write

Figure 19. Single Write

Figure 20. Single Read

If the register address is not defined, the charger IC send back NACK and go back to the idle state.

Programming (continued)

9.5.1.7 Multi-Read and Multi-Write

The charger device supports multi-read and multi-write.

Figure 21. Multi Write

Figure 22. Multi Read

9.5.1.8 Write 2-Byte I²C Commands

A few I²C commands combine two 8-bit registers together to form a complete value. These commands include:

- ChargeCurrent()
- MaxChargeVoltage()
- IIN_DPM()
- OTGVoltage()
- InputVoltage()

Host has to write LSB command followed by MSB command. No other command can be inserted in between these two writes. The charger waits for the complete write to the two registers to decide whether to accept or ignore the new value.

After the completion of LSB and MSB bytes, the two bytes will be updated at the same time. If host writes MSB byte first, the command will be ignored. If the time between write of LSB and MSB bytes exceeds watchdog timer, both the LSB and MSB commands will be ignored.

Table 5. ChargeOption0 Register (I²C address = 01h) Field Descriptions

I ² C 01h	FIELD	TYPE	RESET	DESCRIPTION
7	EN_LWPWR	R/W	1b	Low Power Mode Enable 0b: Disable Low Power Mode. Device in performance mode with battery only. The PROCHOT, current/power monitor buffer and comparator follow register setting. 1b: Enable Low Power Mode. Device in low power mode with battery only for lowest quiescent current. The LDO is off. The PROCHOT, discharge current monitor buffer, power monitor buffer and independent comparator are disabled. ADC is not available in Low Power Mode. Independent comparator can be enabled by setting either REG0X31()[6] or [5] to 1. <default at POR>
6-5	WDTMR_ADJ	R/W	11b	WATCHDOG Timer Adjust Set maximum delay between consecutive I ² C write of charge voltage or charge current command. If device does not receive a write on the REG0x05/04() or the REG0x03/02() within the watchdog time period, the charger will be suspended by setting the REG0x03/02() to 0 mA. After expiration, the timer will resume upon the write of REG0x03/02(), REG0x05/04() or REG0x01[6:5]. The charger will resume if the values are valid. 00b: Disable Watchdog Timer 01b: Enabled, 5 sec 10b: Enabled, 88 sec 11b: Enable Watchdog Timer, 175 sec <default at POR>
4	IDPM_AUTO_DISABLE	R/W	0b	IDPM Auto Disable When CELL_BATPRESZ pin is LOW, the charger automatically disables the IDPM function by setting EN_IDPM (REG0x00[1]) to 0. The host can enable IDPM function later by writing EN_IDPM bit (REG0x00[1]) to 1. 0b: Disable this function. IDPM is not disabled when CELL_BATPRESZ goes LOW. <default at POR> 1b: Enable this function. IDPM is disabled when CELL_BATPRESZ goes LOW.
3	OTG_ON_CHRGOK	R/W	0b	Add OTG to CHRG_OK Drive CHRG_OK to HIGH when the device is in OTG mode. 0b: Disable <default at POR> 1b: Enable
2	EN_OOA	R/W	0b	Out-of-Audio Enable 0b: No limit of PFM burst frequency 1b: Set minimum PFM burst frequency to above 25 kHz to avoid audio noise <default at POR>

Table 5. ChargeOption0 Register (I²C address = 01h) Field Descriptions (continued)

I ² C 01h	FIELD	TYPE	RESET	DESCRIPTION
1	PWM_FREQ	R/W	1b	Switching Frequency Two converter switching frequencies. One for small inductor and the other for big inductor. Recommend 800 kHz with 2.2 µH or 3.3 µH, and 1.2 MHz with 1 µH or 1.5 µH. Host has to set the right PWM frequency after device POR. 0b: 1200 kHz 1b: 800 kHz <default at POR>
0	LOW_PTM_RIPPLE	R/W	1b	PTM mode input voltage and current ripple reduction 0b: Disable 1b: Enable <default at POR>

Table 6. ChargeOption0 Register (I²C address = 00h) Field Descriptions

I ² C 00h	FIELD	TYPE	RESET	DESCRIPTION
7	Reserved	R/W	0b	Reserved
6	SYS_SHORT_DISABLE	R/W	0b	To disable the hiccup mode during the system short protection. 0b: When VSYS is short to lower than 2.4V, the charger enters hiccup mode <default at POR> 1b: The charger hiccup mode is disabled during system short fault
5	EN_LEARN	R/W	0b	LEARN function allows the battery to discharge while the adapter is present. It calibrates the battery gas gauge over a complete discharge/charge cycle. When the battery voltage is below battery depletion threshold, the system switches back to adapter input by the host. When CELL_BATPRESZ pin is LOW, the device exits LEARN mode and this bit is set back to 0. 0b: Disable LEARN Mode <default at POR> 1b: Enable LEARN Mode
4	IADPT_GAIN	R/W	0b	IADPT Amplifier Ratio The ratio of voltage on IADPT and voltage across ACP and ACN. 0b: 20x <default at POR> 1b: 40x
3	IBAT_GAIN	R/W	1b	IBAT Amplifier Ratio The ratio of voltage on IBAT and voltage across SRP and SRN 0b: 8x 1b: 16x <default at POR>
2	EN_LDO	R/W	1b	LDO Mode Enable When battery voltage is below minimum system voltage (REG0x0D/0C()), the charger is in pre-charge with LDO mode enabled. 0b: Disable LDO mode, BATFET fully ON. Precharge current is set by battery pack internal resistor. The system is regulated by the MaxChargeVoltage register. 1b: Enable LDO mode, Precharge current is set by the ChargeCurrent register and clamped below 384 mA (2 cell – 4 cell) or 2A (1 cell). The system is regulated by the MinSystemVoltage register. <default at POR>
1	EN_IDPM	R/W	1b	IDPM Enable Host writes this bit to enable IDPM regulation loop. When the IDPM is disabled by the charger (refer to IDPM_AUTO_DISABLE), this bit goes LOW. 0b: IDPM disabled 1b: IDPM enabled <default at POR>

Table 6. ChargeOption0 Register (I²C address = 00h) Field Descriptions (continued)

I ² C 00h	FIELD	TYPE	RESET	DESCRIPTION
0	CHRG_INHIBIT	R/W	0b	Charge Inhibit When this bit is 0, battery charging will start with valid values in the MaxChargeVoltage register and the ChargeCurrent register. 0b: Enable Charge <default at POR> 1b: Inhibit Charge

9.6.1.2 ChargeOption1 Register (I²C address = 31/30h) [reset = 0211h]

Table 7. ChargeOption1 Register (I²C address = 31h) Field Descriptions

I ² C 31h	FIELD	TYPE	RESET	DESCRIPTION
7	EN_IBAT	R/W	0b	IBAT Enable Enable the IBAT output buffer. In low power mode (REG0x01[7] = 1), IBAT buffer is always disabled regardless of this bit value. 0b Turn off IBAT buffer to minimize Iq <default at POR> 1b: Turn on IBAT buffer
6-5	EN_PROCHOT_LPWR	R/W	00b	Enable $\overline{\text{PROCHOT}}$ during battery only low power mode With battery only, enable VSYS in $\overline{\text{PROCHOT}}$ with low power consumption. Do not enable this function with adapter present. Refer to PROCHOT During Low Power Mode for more details. 00b: Disable low power $\overline{\text{PROCHOT}}$ <default at POR> 01b: Reserved 10b: Enable VSYS low power $\overline{\text{PROCHOT}}$ 11b: Reserved
4	EN_PSYS	R/W	0b	PSYS Enable Enable PSYS sensing circuit and output buffer (whole PSYS circuit). In low power mode (REG0x01[7] = 1), PSYS sensing and buffer are always disabled regardless of this bit value. 0b: Turn off PSYS buffer to minimize Iq <default at POR> 1b: Turn on PSYS buffer
3	RSNS_RAC	R/W	0b	Input sense resistor RAC 0b: 10 mΩ <default at POR> 1b: 20 mΩ
2	RSNS_RSR	R/W	0b	Charge sense resistor RSR 0b: 10 mΩ <default at POR> 1b: 20 mΩ
1	PSYS_RATIO	R/W	1b	PSYS Gain Ratio of PSYS output current vs total input and battery power with 10-mΩ sense resistor. 0b: 0.25 μA/W 1b: 1 μA/W <default at POR>
0	PTM_PINSEL	R/W	0b	Select the ILIM_HIZ pin function 0b: charger enters HIZ mode when pull low the ILIM_HIZ pin. <default at POR> 1b: charger enters PTM when pull low the ILIM_HIZ pin.

Table 8. ChargeOption1 Register (I²C address = 30h) Field Descriptions

I ² C 30h	FIELD	TYPE	RESET	DESCRIPTION
7	CMP_REF	R/W	0b	Independent Comparator Internal Reference. 0b: 2.3 V <default at POR> 1b: 1.2 V
6	CMP_POL	R/W	0b	Independent Comparator Output Polarity 0b: When CMPIN is above internal threshold, CMPOUT is LOW (internal hysteresis) <default at POR> 1b: When CMPIN is below internal threshold, CMPOUT is LOW (external hysteresis)
5-4	CMP_DEG	R/W	01b	Independent Comparator Deglitch Time, only applied to the falling edge of CMPOUT (HIGH → LOW). 00b: Independent comparator is disabled 01b: Independent comparator is enabled with output deglitch time 1 μs <default at POR> 10b: Independent comparator is enabled with output deglitch time of 2 ms 11b: Independent comparator is enabled with output deglitch time of 5 sec
3	FORCE_LATCHOFF	R/W	0b	Force Power Path Off When independent comparator triggers, charger turns off Q1 and Q4 (same as disable converter) so that the system is disconnected from the input source. At the same time, CHRG_OK signal goes to LOW to notify the system. 0b: Disable this function <default at POR> 1b: Enable this function
2	EN_PTM	R/W	0b	PTM enable register bit 0b: disable PTM. <default at POR> 1b: enable PTM.
1	EN_SHIP_DCHG	R/W	0b	Discharge SRN for Shipping Mode When this bit is 1, discharge SRN pin down below 3.8 V in 140 ms. When 140 ms is over, this bit is reset to 0. 0b: Disable shipping mode <default at POR> 1b: Enable shipping mode
0	AUTO_WAKEUP_EN	R/W	1b	Auto Wakeup Enable When this bit is HIGH, if the battery is below minimum system voltage (REG0x0D/0C()), the device will automatically enable 128 mA charging current for 30 mins. When the battery is charged up above minimum system voltage, charge will terminate and the bit is reset to LOW. 0b: Disable 1b: Enable <default at POR>

9.6.3 ChargeCurrent Register (I²C address = 03/02h) [reset = 0000h]

To set the charge current, write a 16-bit ChargeCurrent() command (REG0x03/02h()) using the data format listed in [Figure 32](#), [Table 23](#), and [Table 24](#).

With 10-mΩ sense resistor, the charger provides charge current range of 64 mA to 8.128 A, with a 64-mA step resolution. Upon POR, when auto wakeup is not active, ChargeCurrent() is 0 A. Any conditions for CHRG_OK low except ACOV will reset ChargeCurrent() to zero. CELL_BATPRESZ going LOW (battery removal) will reset the ChargeCurrent() register to 0 A.

Charge current is not reset in ACOC, TSHUT, power path latch off (REG0x30[1]), and SYSOVP.

A 0.1-μF capacitor between SRP and SRN for differential mode filtering is recommended; an optional 0.1-μF capacitor between SRN and ground, and an optional 0.1-μF capacitor between SRP and ground for common mode filtering. Meanwhile, the capacitance on SRP should not be higher than 0.1 μF in order to properly sense the voltage across SRP and SRN for cycle-by-cycle current detection.

The SRP and SRN pins are used to sense voltage drop across RSR with default value of 10 mΩ. However, resistors of other values can also be used. For a larger sense resistor, a larger sense voltage is given, and a higher regulation accuracy; but, at the expense of higher conduction loss. A current sensing resistor value no more than 20 mΩ is suggested.

9.6.3.1 Battery Pre-Charge Current Clamp

During pre-charge, BATFET works in linear mode or LDO mode (default REG0x00[2] = 1). For 2-4 cell battery, the system is regulated at minimum system voltage in REG0x0D/0C() and the pre-charge current is clamped at 384 mA. For 1 cell battery, the pre-charge to fast charge threshold is 3 V, and the pre-charge current is clamped at 384 mA. However, the BATFET stays in LDO mode operation till battery voltage is above minimum system voltage (~3.6 V). During battery voltage from 3 V to 3.6 V, the fast charge current is clamped at 2 A.

9.6.4 MaxChargeVoltage Register (I²C address = 05/04h) [reset value based on CELL_BATPRESZ pin setting]

To set the output charge voltage, write a 16-bit ChargeVoltage register command (REG0x05/04()) using the data format listed in [Figure 33](#), [Table 25](#), and [Table 26](#). The charger provides charge voltage range from 1.024 V to 19.200 V, with 8-mV step resolution. Any write below 1.024 V or above 19.200 V is ignored.

Upon POR, REG0x05/04() is by default set as 4200 mV for 1 s, 8400 mV for 2 s, 12600 mV for 3 s or 16800 mV for 4 s. After CHRG_OK goes high, the charge will start when the host writes the charging current to REG0x03/02(), the default charging voltage is used if REG0x05/04() is not programmed. If the battery is different from 4.2 V/cell, the host has to write to REG0x05/04() before REG0x03/02() for correct battery voltage setting. Writing REG0x05/04() to 0 will set REG0x05/04() to the default value based on CELL_BATPRESZ pin, and force REG0x03/02() to zero to disable charge.

The SRN pin senses the battery voltage for voltage regulation and should be connected as close to the battery as possible, and directly place a decoupling capacitor (0.1 µF recommended) as close to the device as possible to decouple high frequency noise.

9.6.5.1 System Voltage Regulation

The device employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by REG0x0D/0C(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage with BATFET.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is regulated above the minimum system voltage setting. As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

When BATFET is removed, the system node VSYS is shorted to SRP. Before the converter starts operation, LDO mode needs to be disabled. The following sequence is required to configure charger without BATFET.

1. Before adapter plugs in, put the charger into HIZ mode. (either pull pin 6 ILIM_HIZ to ground, or set REG0x35[7] to 1)
2. Set 0x00[2] to 0 to disable LDO mode.
3. Set 0x30[0] to 0 to disable auto-wakeup mode.
4. Check if battery voltage is properly programmed (REG0x05/04)
5. Set pre-charge/charge current (REG0x03/02)
6. Put the device out of HIZ mode. (Release ILIM_HIZ from ground and set REG0x35[7]=0).

In order to prevent any accidental SW mistakes, the host sets low input current limit (a few hundred milliamps) when device is out of HIZ.

9.6.6 Input Current and Input Voltage Registers for Dynamic Power Management

The charger supports Dynamic Power Management (DPM). Normally, the input power source provides power for the system load or to charge the battery. When the input current exceeds the input current setting, or the input voltage falls below the input voltage setting, the charger decreases the charge current to provide priority to the system load. As the system current rises, the available charge current drops accordingly towards zero. If the system load keeps increasing after the charge current drops down to zero, the system voltage starts to drop. As the system voltage drops below the battery voltage, the battery will discharge to supply the heavy system load.

9.6.6.1 Input Current Registers

To set the maximum input current limit, write a 16-bit IIN_HOST register command (REG0x0F/0E()) using the data format listed in [Table 29](#) and [Table 30](#). When using a 10-mΩ sense resistor, the charger provides an input-current limit range of 50 mA to 6400 mA, with 50-mA resolution. The default current limit is 3.3 A. Due to the USB current setting requirement, the register setting specifies the maximum current instead of the typical current. Upon adapter removal, the input current limit is reset to the default value of 3.3 A. The register offset is 50 mA. With code 0, the input current limit is 50 mA.

The ACP and ACN pins are used to sense R_{AC} with the default value of 10 mΩ. For a 20-mΩ sense resistor, a larger sense voltage is given and a higher regulation accuracy, but at the expense of higher conduction loss.

Instead of using the internal DPM loop, the user can build up an external input current regulation loop and have the feedback signal on the ILIM_HIZ pin.

$$V_{ILIM_HIZ} = 1V + 40 \times (V_{ACP} - V_{ACN}) = 1 + 40 \times I_{DPM} \times R_{AC} \quad (2)$$

In order to disable ILIM_HIZ pin, the host can write to 0x32[7] to disable ILIM_HIZ pin, or pull ILIM_HIZ pin above 4.0 V.

9.6.6.1.1 IIN_HOST Register With 10-mΩ Sense Resistor (I²C address = 0F/0Eh) [reset = 4000h]

The register offset is 50 mA. With code 0, the input current limit readback is 50 mA.

9.6.6.1.2 IIN_DPM Register With 10-mΩ Sense Resistor (I²C address = 25/24h) [reset = 0h]

IIN_DPM register reflects the actual input current limit programmed in the register, either from host or from ICO.

After ICO, the current limit used by DPM regulation may differ from the IIN_HOST register settings. The actual DPM limit is reported in REG0x25/24(). The register offset is 50 mA. With code 0, the input current limit read-back is 50 mA.

9.6.6.1.3 InputVoltage Register (I²C address = 0B/0Ah) [reset = VBUS-1.28V]

To set the input voltage limit, write a 16-bit InputVoltage register command (REG0x0B/0A()) using the data format listed in [Figure 37](#), [Table 33](#), and [Table 34](#).

If the input voltage drops more than the InputVoltage register allows, the device enters DPM and reduces the charge current. The default offset voltage is 1.28 V below the no-load VBUS voltage. The DC offset is 3.2 V (0000000).

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The BQ2571xEVM-017 evaluation module (EVM) is a complete charger module for evaluating the BQ25713/BQ25713B. The application curves were taken using the BQ2571xEVM-017. Refer to the EVM user's guide ([SLUUBT8](#)) for EVM information.

10.2 Typical Application

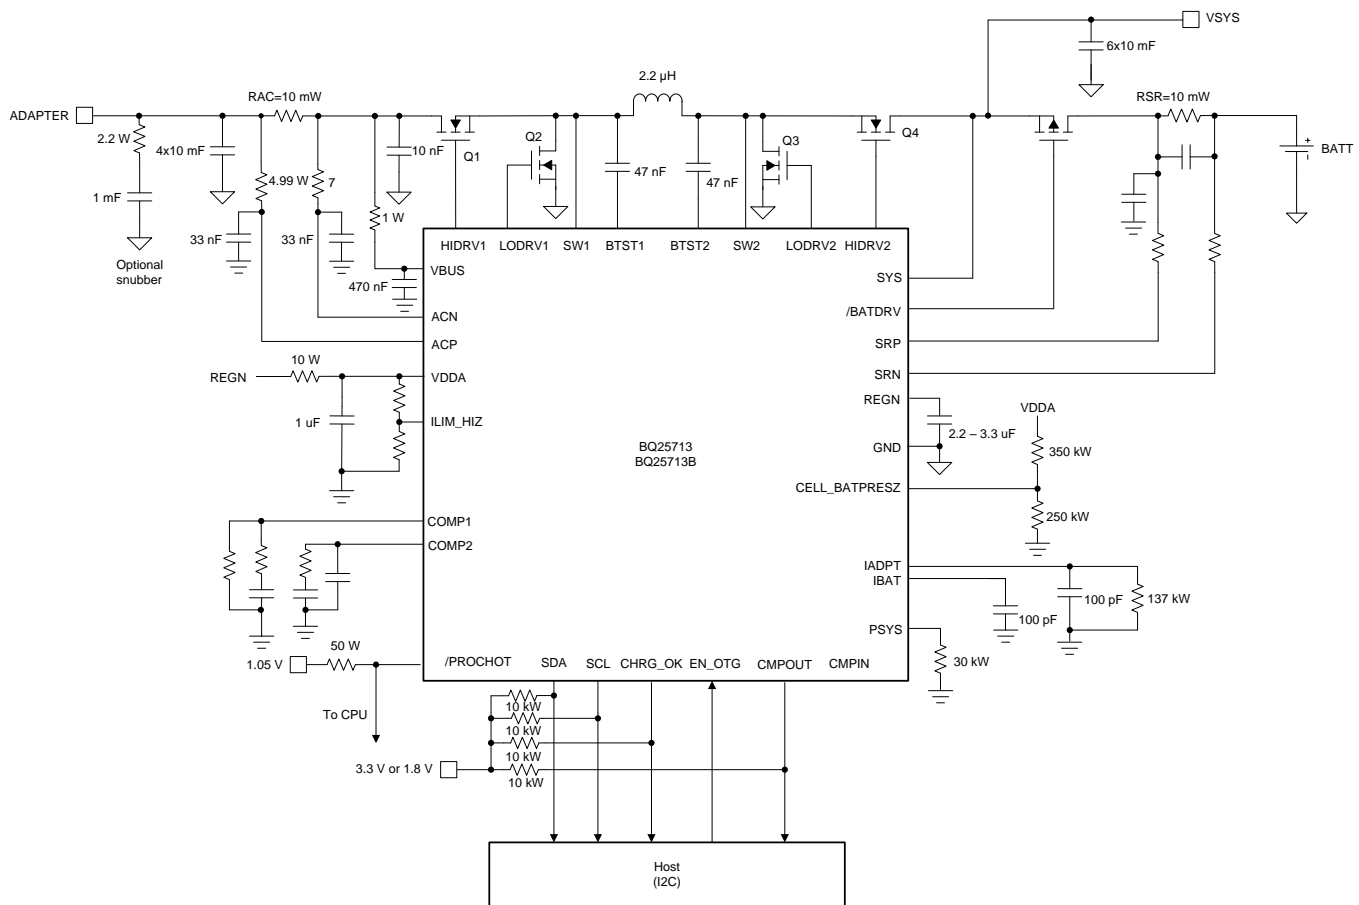

Figure 46. Application Diagram

10.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage ⁽¹⁾	3.5 V < Adapter Voltage < 24 V
Input Current Limit ⁽¹⁾	3.2 A for 65 W adapter
Battery Charge Voltage ⁽²⁾	8400 mV for 2s battery

(1) Refer to adapter specification for settings for Input Voltage and Input Current Limit.

(2) Refer to battery specification for settings.

Typical Application (continued)

DESIGN PARAMETER	EXAMPLE VALUE
Battery Charge Current ⁽²⁾	3072 mA for 2s battery
Minimum System Voltage ⁽²⁾	6144 mV for 2s battery

10.2.2 Detailed Design Procedure

The parameters are configurable using the evaluation software. The simplified application circuit (see [Figure 46](#), as the application diagram) shows the minimum component requirements. Inductor, capacitor, and MOSFET selection are explained in the rest of this section. Refer to the EVM user's guide ([SLUUBT8](#)) for the complete application schematic.

10.2.2.1 ACP-ACN Input Filter

The BQ25713/BQ25713B has average current mode control. The input current sensing through ACP/ACN is critical to recover inductor current ripple. Parasitic inductance on board will generate high frequency ringing on ACP-ACN which overwhelms converter sensed inductor current information, so it is difficult to manage parasitic inductance created based on different PCB layout. Bigger parasitic inductance will generate bigger sense current ringing which will cause the average current control loop to go into oscillation.

For real system board condition, we suggest to use below circuit design to get best result and filter noise induced from different PCB parasitic factor. With time constant of filter from 47 nsec to 200 nsec, the filtering on ringing is effective and in the meantime, the delay of on the sensed signal is small and therefore poses no concern for average current mode control.

Figure 47. ACN-ACP Input Filter

10.2.2.2 Inductor Selection

The BQ25713/BQ25713B has two selectable fixed switching frequency. Higher switching frequency allows the use of smaller inductor and capacitor values. Inductor saturation current should be higher than the charging current (I_{CHG}) plus half the ripple current (I_{RIPPLE}):

$$I_{SAT} \geq I_{CHG} + (1/2) I_{RIPPLE} \quad (3)$$

The inductor ripple current in buck operation depends on input voltage (V_{IN}), duty cycle ($D_{BUCK} = V_{OUT}/V_{IN}$), switching frequency (f_S) and inductance (L):

$$I_{RIPPLE_BUCK} = \frac{V_{IN} \times D \times (1 - D)}{f_S \times L} \quad (4)$$

During boost operation, the duty cycle is:

$$D_{BOOST} = 1 - (V_{IN}/V_{BAT})$$

and the ripple current is:

$$I_{RIPPLE_BOOST} = (V_{IN} \times D_{BOOST}) / (f_S \times L)$$

The maximum inductor ripple current happens with $D = 0.5$ or close to 0.5. For example, the battery charging voltage range is from 9 V to 12.6 V for 3-cell battery pack. For 20-V adapter voltage, 10-V battery voltage gives the maximum inductor ripple current. Another example is 4-cell battery, the battery voltage range is from 12 V to 16.8 V, and 12-V battery voltage gives the maximum inductor ripple current.

Usually inductor ripple is designed in the range of (20 – 40%) maximum charging current as a trade-off between inductor size and efficiency for a practical design.

10.2.2.3 Input Capacitor

Input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current when duty cycle is 0.5 in buck mode. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current occurs where the duty cycle is closest to 50% and can be estimated by [Equation 5](#):

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)} \quad (5)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed to the drain of the high side MOSFET and source of the low side MOSFET as close as possible. Voltage rating of the capacitor must be higher than normal input voltage level. 25 V rating or higher capacitor is preferred for 19 V - 20 V input voltage. Minimum 4 - 6 pcs of 10- μ F 0805 size capacitor is suggested for 45 - 65 W adapter design.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the input capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high input voltages and small capacitor packages. See the manufacturer's datasheet about the performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required value at the operating point.

10.2.2.4 Output Capacitor

Output capacitor also should have enough ripple current rating to absorb output switching ripple current. In buck mode the output capacitor RMS current is given:

To get good loop stability, the resonant frequency of the output inductor and output capacitor should be designed between 10 kHz and 20 kHz. The preferred ceramic capacitor is 25-V X7R or X5R for output capacitor. Minimum 6 pcs of 10- μ F 0805 size capacitor is suggested to be placed by the inductor. Place the capacitors after Q4 drain. Place minimum 10 μ F after the charge current sense resistor for best stability.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the output capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high output voltages and small capacitor packages. See the manufacturer's data sheet about the performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required value at the operating point.

10.2.2.5 Power MOSFETs Selection

Four external N-channel MOSFETs are used for a synchronous switching battery charger. The gate drivers are internally integrated into the IC with 6 V of gate drive voltage. 30 V or higher voltage rating MOSFETs are preferred for 19 V - 20 V input voltage.

Figure-of-merit (FOM) is usually used for selecting proper MOSFET based on a tradeoff between the conduction loss and switching loss. For the top side MOSFET, FOM is defined as the product of a MOSFET's on-resistance, $R_{DS(ON)}$, and the gate-to-drain charge, Q_{GD} . For the bottom side MOSFET, FOM is defined as the product of the MOSFET's on-resistance, $R_{DS(ON)}$, and the total gate charge, Q_G .

$$FOM_{top} = R_{DS(on)} \times Q_{GD}; FOM_{bottom} = R_{DS(on)} \times Q_G \quad (6)$$

The lower the FOM value, the lower the total power loss. Usually lower $R_{DS(ON)}$ has higher cost with the same package size.

The top-side MOSFET loss includes conduction loss and switching loss. It is a function of duty cycle ($D = V_{OUT}/V_{IN}$), charging current (I_{CHG}), MOSFET's on-resistance ($R_{DS(ON)}$), input voltage (V_{IN}), switching frequency (f_s), turn on time (t_{on}) and turn off time (t_{off}):

$$P_{top} = D \times I_{CHG}^2 \times R_{DS(on)} + \frac{1}{2} \times V_{IN} \times I_{CHG} \times (t_{on} + t_{off}) \times f_s \quad (7)$$

The first item represents the conduction loss. Usually MOSFET $R_{DS(on)}$ increases by 50% with 100°C junction temperature rise. The second term represents the switching loss. The MOSFET turn-on and turn-off times are given by:

$$t_{on} = \frac{Q_{SW}}{I_{on}}, \quad t_{off} = \frac{Q_{SW}}{I_{off}} \quad (8)$$

where Q_{SW} is the switching charge, I_{on} is the turn-on gate driving current and I_{off} is the turn-off gate driving current. If the switching charge is not given in MOSFET datasheet, it can be estimated by gate-to-drain charge (Q_{GD}) and gate-to-source charge (Q_{GS}):

$$Q_{SW} = Q_{GD} + \frac{1}{2} \times Q_{GS} \quad (9)$$

Gate driving current can be estimated by REGN voltage (V_{REGN}), MOSFET plateau voltage (V_{plt}), total turn-on gate resistance (R_{on}) and turn-off gate resistance (R_{off}) of the gate driver:

$$I_{on} = \frac{V_{REGN} - V_{plt}}{R_{on}}, \quad I_{off} = \frac{V_{plt}}{R_{off}} \quad (10)$$

The conduction loss of the bottom-side MOSFET is calculated with the following equation when it operates in synchronous continuous conduction mode:

$$P_{bottom} = (1 - D) \times I_{CHG}^2 \times R_{DS(on)} \quad (11)$$

When charger operates in non-synchronous mode, the bottom-side MOSFET is off. As a result all the freewheeling current goes through the body-diode of the bottom-side MOSFET. The body diode power loss depends on its forward voltage drop (V_F), non-synchronous mode charging current (I_{NONSYN}), and duty cycle (D).

$$P_D = V_F \times I_{NONSYN} \times (1 - D) \quad (12)$$

The maximum charging current in non-synchronous mode can be up to 0.25 A for a 10-mΩ charging current sensing resistor or 0.5 A if battery voltage is below 2.5 V. The minimum duty cycle happens at lowest battery voltage. Choose the bottom-side MOSFET with either an internal Schottky or body diode capable of carrying the maximum non-synchronous mode charging current.

11 Power Supply Recommendations

The valid adapter range is from 3.5 V (V_{VBUS_CONVEN}) to 24 V (ACOV) with at least 500-mA current rating. When CHRG_OK goes HIGH, the system is powered from adapter through the charger. When adapter is removed, the system is connected to battery through BATFET. Typically the battery depletion threshold should be greater than the minimum system voltage so that the battery capacity can be fully utilized for maximum battery life.

12 Layout

12.1 Layout Guidelines

The switching node rise and fall times should be minimized for minimum switching loss. Proper layout of the components to minimize high frequency current path loop (see [Layout Example](#) section) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout. Layout PCB according to this specific order is essential.

1. Place the input capacitor as close as possible to the supply of the switching MOSFET and ground connections. Use a short copper trace connection. These parts must be placed on the same layer of PCB using vias to make this connection.
2. The device must be placed close to the gate pins of the switching MOSFET. Keep the gate drive signal traces short for a clean MOSFET drive. The device can be placed on the other side of the PCB of switching MOSFETs.
3. Place an inductor input pin as close as possible to the output pin of the switching MOSFET. Minimize the copper area of this trace to lower electrical and magnetic field radiation but make the trace wide enough to carry the charging current. Do not use multiple layers in parallel for this connection. Minimize parasitic capacitance from this area to any other trace or plane.
4. The charging current sensing resistor should be placed right next to the inductor output. Route the sense leads connected across the sensing resistor back to the device in same layer, close to each other (minimize loop area) and do not route the sense leads through a high-current path (see [Figure 66](#) for Kelvin connection for best current accuracy). Place a decoupling capacitor on these traces next to the device.
5. Place an output capacitor next to the sensing resistor output and ground.
6. Output capacitor ground connections must be tied to the same copper that connects to the input capacitor ground before connecting to system ground.
7. Use a single ground connection to tie the charger power ground to the charger analog ground. Just beneath the device, use analog ground copper pour but avoid power pins to reduce inductive and capacitive noise coupling.
8. Route analog ground separately from power ground. Connect analog ground and connect power ground separately. Connect analog ground and power ground together using power pad as the single ground connection point. Or using a 0-Ω resistor to tie analog ground to power ground (power pad should tie to analog ground in this case if possible).
9. Decoupling capacitors must be placed next to the device pins. Make trace connection as short as possible.
10. It is critical that the exposed power pad on the backside of the device package be soldered to the PCB ground.
11. The via size and number should be enough for a given current path. See the EVM design ([SLUUBT8](#)) for the recommended component placement with trace and via locations. For WQFN information, see [SLUA271](#).

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

RSN (S-PWQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

RSN (S-PWQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
