ABOUT THIS GUIDE

Data Sheet Description and Organization

This data sheet describes the C-5 Network processor, Version D0. It provides hardware layout specifications including pinouts, memory configuration guidelines, timing diagrams, power and power sequencing guidelines, thermal design guidelines, and mechanical specifications.

The data sheet is divided into the following topics:

- [Functional Description](#)
- [Signal Descriptions](#)
- [Electrical Specifications](#)
- [Mechanical Specifications](#)

Using C-Port Electronic Documents

C-Port electronic documents are provided as PDF files. Open and view them using the Adobe® Acrobat® Reader application, version 3.0 or later. If necessary, download the Acrobat Reader from the Adobe Systems, Inc. web site:

<http://www.adobe.com/prodindex/acrobat/readstep.html>

Each provided PDF file offers several ways for moving among the document's pages, as follows:

To move quickly from section to section within the document, use the *Acrobat bookmarks* that appear on the left side of the Acrobat Reader window. The bookmarks provide an expandable 'outline' view of the document's contents. To display the document's Acrobat bookmarks, press the 'Display both bookmarks and page' button on the Acrobat Reader tool bar.

To move to the referenced page of an entry in the document's Contents or Index, click on the entry itself, each of which is "hot linked."

To follow a [cross-reference](#) to a heading, figure, or table, click the blue text.

To move to the beginning or end of the document, to move page by page within the document, or to navigate among the pages you displayed by clicking on hyperlinks, use the Acrobat Reader navigation buttons shown in this figure:

Table 1 summarizes how to navigate within a C-Port electronic document.

Table 1 Navigating Within a C-Port Electronic Document

TO NAVIGATE THIS WAY	CLICK THIS
Move from section to section within the document.	A bookmark on the left side of the Acrobat Reader window
Move to an entry in the document’s Contents or Index.	The entry itself
Follow a cross-reference (highlighted in blue text).	The cross-reference text

Move to the beginning or end of the document.	The appropriate Acrobat Reader navigation buttons
Move backward or forward among a series of hyperlinks you have selected.	The appropriate Acrobat Reader navigation buttons

Guide Conventions

The following visual elements are used throughout this guide, where applicable:

This icon and text designates information of special note.

Warning: *This icon and text indicate a potentially dangerous procedure. Instructions contained in the warnings must be followed.*

Warning: This icon and text indicate a procedure where the reader must take precautions regarding laser light.

This icon and text indicate the possibility of electro-static discharge (ESD) in a procedure that requires the reader to take the proper ESD precautions.

Revision History

Table 2 shows the revision history for this data sheet, providing a description of the changes.

Table 2 C-5 Network Processor Data Sheet Revision History

REVISION DATE	CHANGE	PAGE NO.
March 10, 2000	First printing for the C-5 NP.	
June 12, 2000	Chapter 2 contains the following revisions: <ul style="list-style-type: none"> • LVTTTL and LVPECL specifications have been added. • Several of the tables listing pin configurations have had their descriptions updated. Check each application's configuration table as required. • CPn3+1 is RCLKN (5/25/00), not NC (3/10/00) • Mechanism for EPROM signaling has changed. • XPUHOT functionality is clarified • QCPA is a NC (5/25/00), not Address Parity (3/10/00) • The power and ground connections illustration has been updated. Chapter 3 contains the following revisions: <ul style="list-style-type: none"> • Many values listed in individual timing diagrams and specification tables have updated or corrected. Check each specification table as required. • Low speed serial interface timing specifications have been added. • PROM I/F timing specifications are changed 	17 18 - 39 25 31 31 36 38 61 - 78 71 72
June 14, 2000	QMU timing specification for Tqdo has been changed from 2.2 to 1.5.	77
July 17, 2000	Updated BMU section to reflect change to external Pipeline Architecture, Single Data Rate Synchronous DRAM.	12

Table 2 C-5 Network Processor Data Sheet Revision History

REVISION DATE	CHANGE	PAGE NO.
August 8, 2000	Operating temperature range added.	54
	Power sequencing diagram updated.	56
	BMU timing diagram updated.	75
	TLU timing diagram updated.	77
	QMU timing diagram updated.	78
March 26, 2001	Chapter 1 contains the following revisions:	Thru-out
	• Fabric Processor Interface Frequency changed from 100 MHz to 110 MHz throughout.	
	• TLU interface memory was incorrectly noted at 64 MBytes. Changed to 32 MBytes.	18
	The maximum amount of memory supported by the TLU is 32MBytes in four banks.	
	Chapter 2 contains the following revisions:	19
	• Buffer Management Unit (BMU) has 161 pins	
	• Added Figure 5. PROM Interface Timing Outline	21
	• Added Figure 7. Observe-Only Cell	37
	• Added Figure 8. Cell Design That Can Be Used for Both Input and Output Pins	57
	• PROM Interface Timing Outline added.	
	• Numerous changes in tables 17, 18 and 19	36
	• Data lines incorrectly noted at 128. The useful configuration is 139 data lines and all 12 address lines.	39, 40
	• The TLU SRAM interface was incorrectly noted at 64 MBytes. Changed to 32 MBytes.	41
	Chapter 3 contains the following revisions:	42
	• Table 40, Gigabit Ethernet (TBI) Timing Description, Tcgr min value of -1.0 removed.	
	• Figure 16, OC 12 Clock Duty Cycle was added	71
	• Tc12d added to Table 42	73
	• Figure 17, Executive Processor PCI Timing Diagram PGNTX is only an input. PGNTX Output removed.	73
	• Tpgo, Tpgz, Tpgv removed from Table 43.	74
	Chapter 4 contains the following revisions:	75
	• Mechanical specs changed.	

Table 2 C-5 Network Processor Data Sheet Revision History

REVISION DATE	CHANGE	PAGE NO.
October 1, 2001	Chapter 2 contains the following revisions: <ul style="list-style-type: none"> • LVTTTL and LVPECL conform to the JEDEC JESD8-B Specification • Table 3 changed to note LVPECL differential signal • Table 10 LVPECL change • Table 11 CP_n_6 and CP_n+1_6 changed • Table 21 changed to reflect pin G14 used for signal MDQML • Table 27 changed to reflect total number of NC pins for D0 • Table 28 changed to reflect G14 receiving signal MDQML • C-Port web site support address added Chapter 3 contains the following revisions <ul style="list-style-type: none"> • Table 32 Storage / max junction temperatures added • Table 34 LVPECL high and low voltage min / max added • Table 36 Power dissipation, P_D min, max, typical changed Chapter 4 contains the following revisions <ul style="list-style-type: none"> • Added "Marking Codes" • Added "Reflow" profile 	23 23 31 31 32 42 48 61 63 65 67 91 91
September 9, 2002	Chapter 1 contains the following revisions: <ul style="list-style-type: none"> • Table 4 contain revised TLU SRAM Configuration specifications Chapter 2 contains the following revisions: <ul style="list-style-type: none"> • TLU SRAM Interface Signals: Table 24 and Table 25 changed to reflect Memory Bank Selection Chapter 3 contains the following revisions: <ul style="list-style-type: none"> • Table 50, Table 51 and Table 53 contain revised timing specifications 	25 49 87 thru 90

Related Product Documentation

The following table lists the C-5 and CST documentation set. Find the latest editions of these documents for your installed CST version in the Support section of the C-Port Corporation web site:

Table 3 C-Port Silicon Documentation Set

DOCUMENT SUBJECT	DOCUMENT NAME	PURPOSE	DOCUMENT ID
Processor Information	<i>C-5 Network Processor Architecture Guide</i>	Describes the full architecture of the C-5 network processor.	C5NPARCH-RM/D

FUNCTIONAL DESCRIPTION

Feature List

Complete programmability

- Programmability at all levels of the protocol stack: Layers 2-7
- Examples of C-5 enabled systems:
 - Multiservice Access Platforms (MSAPs)
 - Optical edge switch/routers
 - IP Gigabit/Terabit routers
 - WAN Customer Premises Equipment (CPE)
 - Load balancing web server switches

Simple programming model

- C/C++ programmable
- Standard instruction set
- Standard Applications Programming Interface (C-Ware API™)
- Comprehensive C-Ware™ Software Toolset (easy to program, debug, and tune applications)

Maximum system flexibility

- Software implementation of functions from physical interfaces through switching fabric support
- Reprogram to support new functionality and ratified standards, improving your time-in-market™ metric
- Deliver new services to market through simple software upgrades — no forklift

Massive processing power

- Operating frequencies: 166MHz, 200MHz, and 233MHz
- 5Gbps of bandwidth (for non-blocking throughput)

- More than 3,000MIPs of computing power (for adding services throughout the protocol stack)
- Up to 15 million packets per second transmitted at wire speed
- 17 programmable RISC Cores (for cell/packet forwarding)
- 32 programmable Serial Data Processors (for processing bit streams)
- Up to 133 million table lookups per second
- Three internal buses for 60Gb of aggregate bandwidth

High functional integration

- 838 pin Ball Grid Array (BGA) package
- 16 Channel Processors including:
 - Embedded OC-3c, OC-12, OC-12c SONET framers
 - Programmable MAC interface
 - RISC Cores
 - Programmable pin PHY interfaces
- Embedded coprocessors for table lookup (classification), buffer memory (payload control), and queue management (CoS/QoS implementation)
- Dedicated Fabric Processor and port
- Embedded RISC Executive Processor
- Integrated 32bit/66MHz PCI bus

Stable programming interfaces

- Supports generic communications programming interfaces to simplify programming and allow future reuse of code across generations of the processor
- Network Processing Forum (NPF), (formerly CPIX), Charter member

Third-party support

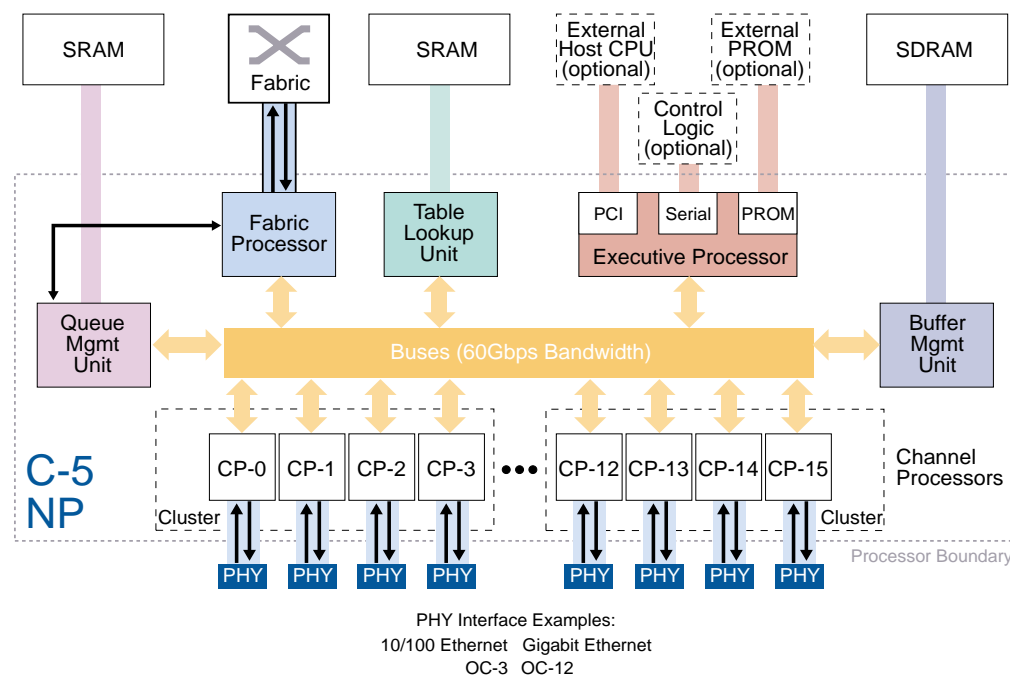

- Support for virtually any third-party protocol stack, PHY or fabric interface, and industry standard tools
- Smart Networks Alliance Program ensures a wide range of verified solutions

Block Diagram

The C-5™ network processor, has an architecture specifically designed for networking applications. Figure 1 shows a block diagram of the C-5 NP, including its potential external interfaces. The following sections describe each component of the C-5 NP.

For more information about the architecture of the C-5 NP, see the *C-5 Network Processor Architecture Guide*.

Figure 1 C-5 Network Processor Block Diagram

The main components of the C-5 NP are:

- Channel Processors
- Executive Processor
- Fabric Processor
- Buffer Management Unit
- Table Lookup Unit
- Queue Management Unit

Channel Processors

The C-5 NP contains sixteen programmable Channel Processors (CPs) that receive, process, and transmit network data. The number of CPs per port is configurable, depending on the line interface. Typically one CP is assigned to each port for medium bandwidth applications (Fast Ethernet to OC-3). Multiple CPs can be assigned to a port in a configuration called *channel aggregation* in high bandwidth applications (greater than OC-3). Multiple logical ports can be assigned to a single CP, with the addition of an external multiplexor, for low bandwidth applications, such as DS1 to DS3.

The C-5 NP's architecture supports a variety of industry-standard serial and parallel protocols and individual port data rates including:

- 10Mb Ethernet (RMII)
- 100Mb Ethernet (RMII)
- 1Gb Ethernet (GMII and TBI)
- OC-3
- OC-12
- DS1/DS3, supported through the use of external framers/multiplexors

The C-5 NP's programmability can also support a variety of special interfaces, such as various xDSL encapsulations and proprietary protocols.

Key components of each CP are a RISC Core (CPRC) that orchestrates cell/packet processing and a set of microprogrammable, special-purpose processors, called Serial Data Processors (SDPs), that provide features such as Ethernet MAC and SONET framing, multichannel HDLC, and ATM cell delineation. This means you usually only need to include PHYs to complete the system.

Executive Processor

The Executive Processor (XP) serves as a centralized computing resource for the C-5 NP and manages the system interfaces.

The XP performs conventional supervisory tasks in the C-5 NP, including:

- Reset and initialization of the C-5 NP
- Program loading and control of CPs
- Centralized exception handling

- Management of a host interface through the PCI
- Management of system interfaces (PCI, Serial Bus, PROM)

System Interfaces

The system interfaces to the XP are:

- **PCI** — Provides an industry standard 32bit 33/66MHz PCI channel used for chip-level shared resources. The PCI has both *initiator* and *target* capabilities. The PCI interface is typically connected to a host processor.
- **Serial Bus Interface** — Provides a general purpose bi-directional, two-wire serial bus and I/O port that allows the C-5 NP to control external logic with either of two standard protocols:
 - The **MDIO (high-speed) protocol**: uses a 16bit data format with 10bits of addressing and supports transfers up to 25MHz.
 - The **low-speed protocol**: uses an 8bit data format followed by an acknowledge bit and supports transfers up to 400kbps.

Software is used to select which protocol to use, by setting the appropriate bits in the Serial Bus Configuration Register. When a serial bus transfer is active, an external pin is driven by the C-5 NP to indicate which protocol is being used (SPLD=0 indicates MDIO protocol; SPLD=1 indicates low-speed protocol).

Both SIDA and SICL are bi-directional lines that are connected, via an external pull-up resistor, to a positive supply voltage. When the bus is free, both lines are HIGH because of the pull-up resistor. The output stages of the devices connected to the bus must have either an open-drain or open-collector in order to perform the wired-AND function required for its arbitration mechanism.

- **PROM Interface** — Allows the XP to boot from nonvolatile, flash memory. The PROM interface is a low-speed, serial I/O port that runs at $1/2$ to $1/16$ the core clock rate. The maximum PROM size is 8MBytes, and a 16bit wide configuration is required. External board logic is required to perform serial-to-parallel conversion for PROM address outputs and parallel-to-serial conversion for PROM data inputs.

Fabric Processor

The Fabric Processor (FP) acts as a high-speed network interface port with advanced functionality. It allows the C-5 NP to interface to an application-specific switching solution internal to your design. The FP port supports the bidirectional transfer of packets, frames,

or cells from the C-5 NP to a hardware interface that provides connectivity to other network processors or other similar line processing hardware. There are numerous parameters that can be configured within the FP to allow the interface to be adapted to different fabric protocols. The FP is Utopia-1, 2 and Utopia-3, IBM PRIZMA, and PowerX (Csix-L0) compatible.

The FP can be configured to run at any frequency up to 110MHz, and the receive and transmit data buses are 16 or 32 bits wide. This allows a wide range of supported bandwidths to and from the switching fabric, all the way up to 3200Mbps full duplex bandwidth.

Buffer Management Unit

The Buffer Management Unit (BMU) interfaces the C-5 NP to external pipeline architecture, Single Data Rate Synchronous DRAM. The external memory is partitioned and used as buffers for receiving and transmitting data between CPs, the FP, and the XP. It is also used as second level storage in the XP memory hierarchy.

The interface to an array of SDRAM chips is 139bits wide, composed of 128 data bits, two internal control bits, and nine SECCDED (single error correction-double error detection) ECC (error correction code) bits. The interface is compliant with the PC100 standard and operates at up to 125MHz with 3.3V LVTTTL-compatible inputs and outputs. The refresh period, Trcd, Tcas, Trp, Tmrd, and Trc are configurable via boot time configuration (see the *C-5 Network Processor Architecture Guide* for more details).

The C-5 NP uses auto-refresh mode and the interface, (which is not configurable), transfers four bits of data for each read and write using a sequential burst type.

Some of these parameters are programmed into the SDRAMs' mode register and can be applied only once per power cycle. The ECC functionality can be enabled or disabled via configuration register writes.

If needed, the interface can narrowed to 128bits by disabling ECC and providing board pull-ups for the two control bits and nine ECC bits. This is useful if DIMMs are used in the board design. If individual SDRAM parts are used, x16 and x32 are supported. The BMU supports SDRAM devices that use 12 address lines. Internal address calculation paths limit the maximum memory size to 128MBytes. Only one physical bank of SDRAM is supported.

Table Lookup Unit

The Table Lookup Unit (TLU) performs table lookups in external SRAM. It can also be used for statistics accumulation and retrieval and as general data storage. The TLU

simultaneously supports multiple application-defined tables and multiple search strategies, such as those needed for routing, circuit switching, and QoS lookup tasks.

The C-5 NP uses external 64bit wide ZBT Pipelined Bursting Static RAM (SRAM) modules (at frequencies to 133MHz) for storage of its tables. These modules allow implementation of tables with 2²⁰ x 64bit entries at a cycle time of up to 7.5 nanoseconds using 4Mbit SRAM technology. The maximum amount of memory supported by the TLU is 32MBytes in four banks.

Table 4 TLU SRAM Configurations

SRAM TECHNOLOGY*	MIN TABLE SIZE (ONE BANK)	NO. OF PARTS	MAXIMUM TABLE SIZE (FOUR BANKS)	NO. OF PARTS
1Mbit (32k x 32)	256kBytes	2	1MBytes	8
2Mbit (64k x 32)	512kBytes	2	2MBytes	8
4Mbit (256k x 18)	2MBytes	4	8MBytes	16
8Mbit (512k x 18)	4MBytes	4	16MBytes	16
16Mbit (1M x 18)	8MBytes	4	32MBytes	16

* For (n x 32) parts, divide total memory and number of parts by two.

External Mode

There is support for external devices. Refer to the *C-5 Architecture Guide*.

Queue Management Unit

The Queue Management Unit (QMU) autonomously manages a number of application-defined descriptor queues. It handles inter-CP and inter-C-5 NP descriptor flows by providing switching and buffering. It also performs descriptor replication for multicast applications. A number of queues can be assigned to each CPRC for QoS-based services.

The QMU provides a queuing engine internal to the chip and uses external SRAM to store the descriptors. Scheduling is done by the CPs. The QMU supports up to 512 queues and 16, 384 descriptor buffers. A descriptor buffer holds an application-defined “descriptor”, which is a structure that defines the payload buffer handle and other attributes of the forwarded cell or packet.

The QMU’s external SRAM interface uses ZBT synchronous SRAMs organized in a single bank of up to 128k, 32bit words. This interface runs at half (1/2) the core clock frequency.

SIGNAL DESCRIPTIONS

Signal Summary

There are ten functional groupings of signals in the C-5 network processor:

- Clock — 11 pins
- Channel Processors (CP0 - CP15) — $16 \times 7 = 112$ pins
- Executive Processor (XP) — 57 pins
 - PCI Interface — 50 pins
 - PROM Interface — 4 pins
 - Serial Bus Interface — 2 pins
 - General System Interface — 1 pin
- Fabric Processor (FP) — 80 pins
- Buffer Management Unit (BMU) — 161 pins
- Table Lookup Unit (TLU) — 100 pins
- Queue Management Unit (QMU) — 55 pins
- Power — 233 pins
- Test — 18 pins
- No connection (NC) — 11 pins

Two of the sections (CPs and FP) are configurable, depending on the type of device being implemented.

Pinout Diagram

The C-5 NP contains 838 pins as shown in [Figure 2](#). These pin numbers are referenced throughout the remaining chapter.

Figure 2 Pin Locations (Bottom View)

Pin Descriptions Grouped by Function

The C-5 NP pins are categorized in groups, reflecting interfaces to the chip:

- [Clock Signals](#)
- [CP Interface Signals](#)
- [Executive Processor System Interface Signals](#)

- [Fabric Processor Interface Signals](#)
- [BMU SDRAM Interface Signals](#)
- [TLU SRAM Interface Signals](#)
- [QMU SRAM Interface Signals](#)
- [Power Supply Signals](#)
- [Test Signals](#)
- [No Connection Pins](#)

LVTTTL and LVPECL Specifications

C-5 NP pins are the following types:

- Low Voltage TTL-Compatible (LVTTTL). The C-5 NP's LVTTTL pins conform to the JEDEC JESD8-B specification.
- Low Voltage Positive Emitter Coupled Logic (LVPECL). The C-5 NP's LVPECL pins conform to the JEDEC JESD8-2 specification.

Clock Signals

[Table 5](#) describes the C-5 NP clock signals.

Table 5 Clock and Reference Signals

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
SCLK*	H15	1	LVPECL	I	Core Clock Rate (Differential)
SCLKX*	G15	1	LVPECL	I	
CCLK0	K12	1	LVTTTL	I	1_544MHZ_CLK (T1)†
CCLK1	J13	1	LVTTTL	I	2_048MHZ_CLK (E1)†

Table 5 Clock and Reference Signals (continued)

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
CPREF†	L13	1	LVPECL	I	Reference
TOTAL		11			

* SCLK and SCLKX must not be AC-coupled.

† The frequencies specified for CCLK0 - CCLK7 allow full flexibility for the C-5 NP. Clock inputs associated with a specific protocol should be wired to ground when that protocol is not used by the C-5 NP. It is also possible to use one or more CCLK n inputs for other frequencies. Contact your C-Port representative for more information.

‡ If any of the CPs are configured for LVPECL operation (OC3) using the pin mode registers, then CPREF must be wired to an external reference, as specified in [Table 36](#) on page 68. If none of the CPs are configured for LVPECL operation, then the CPREF pin can be left unconnected. It is acceptable to tie the CPREF pin high or low through a resistor, or into the specified reference, but this is not required.

CP Interface Signals

The C-5 NP’s 16 CPs support various network physical interfaces, providing a serial interface to the PHY layer. Interfaces are configured via bits in the C-5 NP register set. Many interfaces are possible by programming the configuration registers. CPs can be used individually or in a cluster (four CPs) to implement the various interfaces.

[Table 6](#) provides a quick reference of all the CP pins organized by clusters. There are seven physical I/O pins associated with each CP. All pins are capable of receiving data, with some configurable to be input clocks, output clocks, or data drivers. In addition, pairs of pins can be configured as differential pairs for LVPECL compatibility.

In the case of RMII, OC-3, DS1, and DS3, the drivers and receivers at the pin are locally configured to match the relevant PHY or Framer chip. OC-12 uses the aggregation of four CPs (one cluster), while GMII and Ten Bit Interface (TBI) can use either eight CPs (four for receive and four for transmit) or four CPs that share the transmit and receive functions for non-wire speed applications.

During CP aggregation, all 28 pins associated with a cluster are routed to all of the Serial Data Processors (SDPs) in that cluster. This allows round-robin usage of portions of the SDPs, with each getting access to the necessary I/O pins.

The signals for the following CP physical interfaces are included in this section:

- [DS1/T1 Framer Interface Configuration](#)
- [10/100 Ethernet \(RMII\) Configuration](#)
- [Gigabit Ethernet \(GMII\) Configuration](#)

- [Gigabit Ethernet and Fibre Channel TBI Configuration](#)
- [SONET OC-3 Transceiver Interface Configuration](#)
- [SONET OC-12 Transceiver Interface Configuration](#)

† Reference [Table 6](#) for pin numbers for the actual cluster(s) you are configuring.

10/100 Ethernet (RMII) Configuration

[Table 8](#) describes the 10/100BASE-T Ethernet Reduced Media Independent Interface (RMII) signals. For each CP (0-15), you can implement one 10/100 Ethernet interface.

Table 8 10/100 Ethernet Signals

SIGNAL NAME*	PIN #	TOTAL	TYPE	I/O	LABEL	SIGNAL DESCRIPTION
CPn_0	Table 6	1	LVTTL	O	REF_CLK	Transmit and Receive Clock (50MHz)
CPn_1	Table 6	1	LVTTL	I	CRS_DV	Carrier Sense (CRS)/ Receive Data Valid (RX_DV). CRS indicates that traffic is on the link, and is asserted if the signal is a 1 or an alternating 1010... RX_DV indicates that a receive frame is in progress and the data present on the RXD pins is valid. It is asserted if this signal is a 1 for more than one cycle.
CPn_2	Table 6	1	LVTTL	O	TXD(0)	Transmit Data 0 (first on wire)
CPn_3	Table 6	1	LVTTL	O	TXD(1)	Transmit Data 1 (second on wire)
CPn_4	Table 6	1	LVTTL	I	RXD(0)	Receive Data 0 (first on wire)
CPn_5	Table 6	1	LVTTL	I	RXD(1)	Receive Data 1 (second on wire)
CPn_6	Table 6	1	LVTTL	O	TX_EN	Transmit Enable. When asserted, the data on TXD is encoded and transmitted on the twisted pair cable.
TOTAL PINS		7				

* n can be from 0 to 15. See [Table 6](#).

Gigabit Ethernet (GMII) Configuration

Gigabit Ethernet Media Independent Interface (GMII) is configured in one of two ways:

- 1 Use one CP cluster when density is more important than wire-speed performance because you can then implement up to four Gigabit Ethernet ports per C-5 NP.
- 2 Use two CP clusters for wire-speed performance and additional processing power. You can implement up to two Gigabit Ethernet ports per C-5 NP.

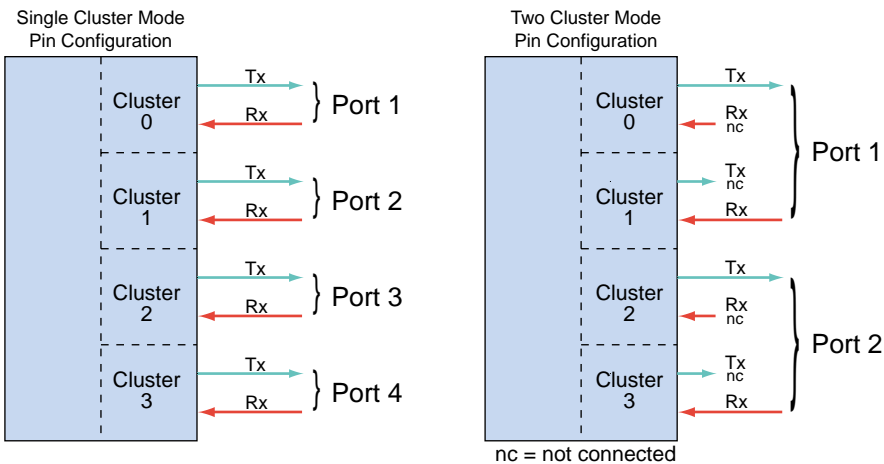

[Table 9](#) lists the possible CP cluster combinations you can use and [Figure 3](#) shows receive and transmit pin configurations by cluster. [Table 10](#) lists the signals and pinouts for Gigabit Ethernet (GMII).

Table 9 Transmit and Receive Pin Combinations for Gigabit Ethernet and Fibre Channel

CLUSTER	SINGLE CLUSTER MODE (TBI OR GMII)	TWO CLUSTER MODE (GMII)*
0	Port 1 Tx and Rx	Port 1 Tx
1	Port 2 Tx and Rx	Port 1 Rx
2	Port 3 Tx and Rx	Port 2 Tx
3	Port 4 Tx and Rx	Port 2 Rx

* The Two Cluster Mode column lists typical configurations. Any cluster can be set up to either receive or transmit. So you could configure a dual cluster mode where cluster 0 receives and cluster 3 transmits.

Figure 3 GMII/TBI Transmit and Receive Pin Configurations

The unused CP pins in the two cluster configurations should be wired to ground using a resistor.

Table 10 Gigabit Ethernet (GMII/MII) Signals One Cluster Example

SIGNAL NAME*	PIN #†	TOTAL	TYPE	I/O	LABEL	SIGNAL DESCRIPTION

**Executive Processor
System Interface Signals**

The XP’s system interface manages the supervisory controls for the network interfaces, as well as the set of pins that provide interfaces to other components in the system that are not memories or network interfaces. It is also the primary interface used for initializing the C-5 NP after reset. The XP signals include PCI signals, Serial interface signals, and PROM interface signals.

PCI Signals

The PCI can be configured to support a 32bit PCI capable of operating at either 33MHz or 66MHz. The PCI is fully compliant with PCVI Specification revision 2.1. Table 14 describes the PCI signals.

Table 14 PCI Signals

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
PAD0 - PAD31	T22, R21, P21, T21, R20, P20, T20, R19, Q20, S20, R18, P19, T19, R17, P18, T18, R16, Q18, S18, S16, P17, T17, R15, P16, T16, S14, Q16, T15, R14, P15, T14, Q14	32	PCI	I/O	Multiplexed Address/Data Bus. These signals are multiplexed address and data bits. The C-5 NP receives addresses as target and drives addresses as master. It drives the data and receives read data as master.
PCBEX0 - PCBEX3	N21, N20, M20, O20	4	PCI	I/O	Command byte enables. These signals are multiplexed command and byte enabled signals. The C-5 NP receives byte enables as target and drives byte enables as master.
PPAR	P14	1	PCI	I/O	Parity. This signal carries even parity for AD and CBE# pins. It has the same receive and drive characteristics as the address and data bus, except that it is one PCI cycle later.
PFRAMEX	K20	1	PCI	I/O	Cycle frame
PTRDYX	L20	1	PCI	I/O	Target ready for data transfer
PIRDYX	L19	1	PCI	I/O	Initiator ready for data transfer

TOTAL PINS		50			

Serial Interface Signals

The Serial interface is a bidirectional two-wire serial bus. It can use one of the following formats:

- 1

An 8bit data format followed by an acknowledge bit, which supports transfers at up to 400kbps (low speed).
- 2

a 16bit IEEE 802.3 MDIO data format with 10bits of addressing, which supports transfers up to 25MHz (high speed).

The signals and pins are identical for both the high and low speed protocols.

Which of the two data rates used is selected by the state of the PROM interface's SPLD signal that is asserted while the PROM interface is idle. When SPLD is asserted HI the low speed serial bus protocol is selected and when SPLD is asserted LOW the MDIO protocol is selected.

The bus only supports a single master hierarchy that can operate as either a receiver or a transmitter. The bus also supports collision detection and arbitration, and an integrated addressing and data-transfer protocol.

Both SIDA and SICL are bidirectional lines that are connected, through a pull-up resistor, to a positive supply voltage. When the bus is free, both lines are HIGH. The output stages

of the devices connected to the bus must have either an open-drain or open-collector in order to perform the wired-AND function required for its arbitration mechanism.

Table 15 Serial Port Signals

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
SICL	O14	1	LVTTL	I/O	Serial Clock line
SIDA	N14	1	LVTTL	I/O	Serial Data line
TOTAL PINS		2			

PROM Interface Signals

The PROM interface is a low speed I/O port that allows the C-5 NP to communicate through external logic to PROM. The PROM clock is $\frac{1}{2}$ to $\frac{1}{16}$ the core clock rate. The maximum PROM size is 4MBytes x 16, and configuration is required. The PROM signals are listed in [Table 16](#).

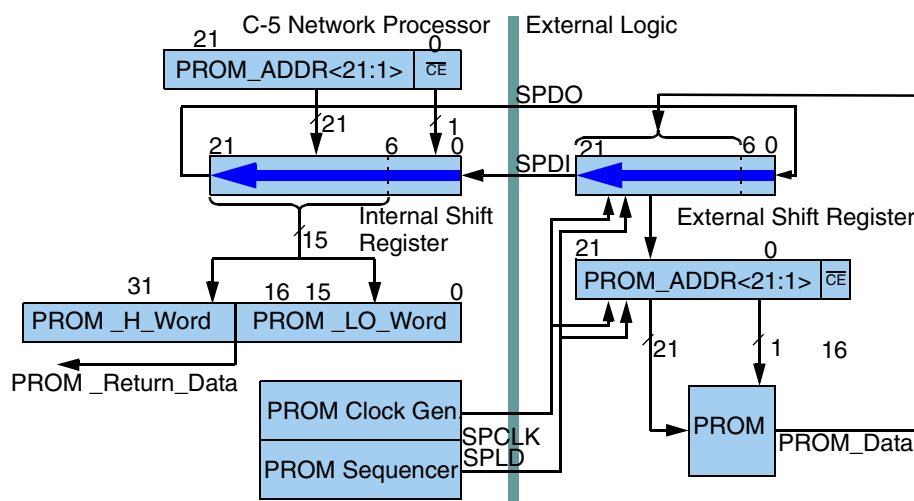

Table 16 PROM Interface Signals

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
SPDO	N15	1	LVTTL	O	Serial Data Out
SPDI	N16	1	LVTTL	I	Serial Data In
SPLD	M16	1	LVTTL	O	When load is asserted on a positive clock edge, the external logic performs a parallel load. On each positive clock edge when load is de-asserted, the shift registers shift. When the PROM interface is idle: <ul style="list-style-type: none">• if SPLD is asserted HI it indicates low speed serial protocol,• if asserted LOW it indicates MDIO serial protocol.

[Figure 4](#) shows the connections between the PROM Interface and external board logic. The application is required to provide an external shift register with parallel-in and parallel-out capabilities, and a parallel load register. Both devices should be

positive-edge-triggered and perform a parallel load whenever SPLD is asserted. When SPLD is deasserted the shift register shifts.

Figure 4 PROM Interface Diagram

The PROM interface operates in the following manner:

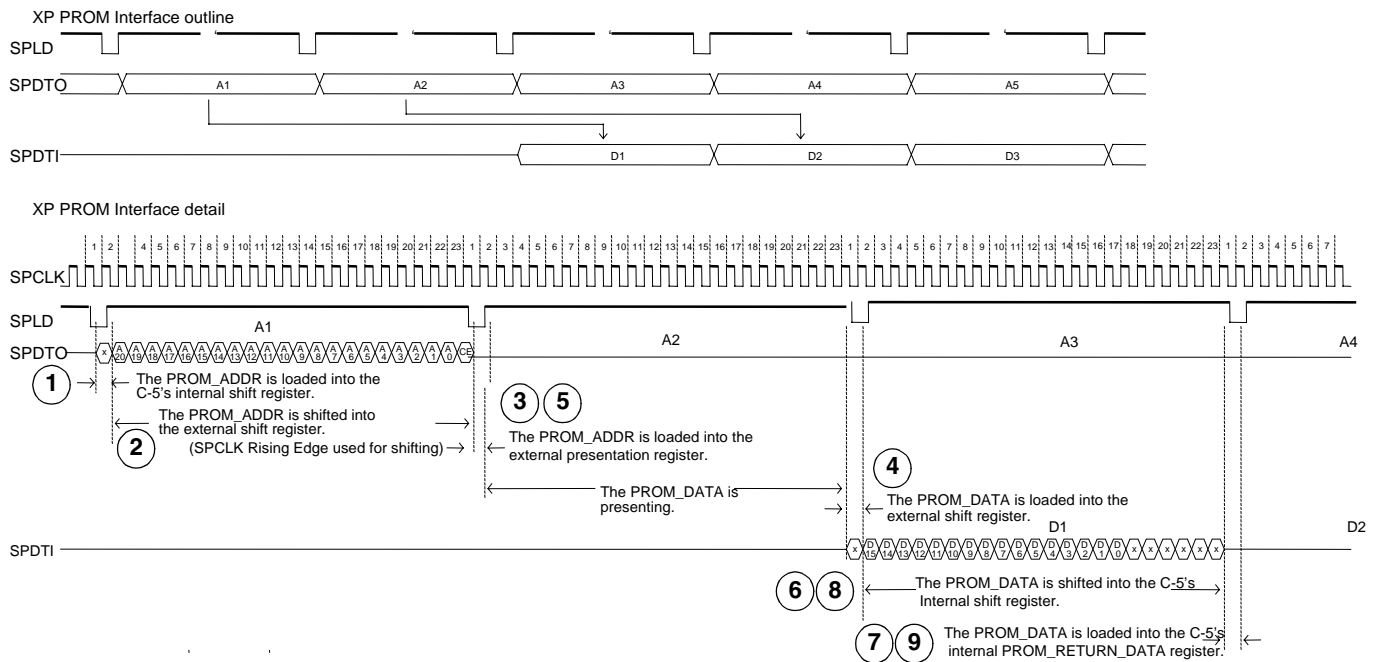

Two accesses are pipelined together to execute one 32-bit fetch. The steps are shown in Figure 5.

- 1** The PROM_ADDR is loaded into the network processor internal shift register.
- 2** The PROM_ADDR is shifted into the external shift register for 22 SPCLK cycles.
- 3** SPLD is asserted for one SPCLK cycle, loading the PROM_ADDR into the external presentation register.
- 4** SPLD is deasserted for 22 SPCLK cycles. The PROM presents the first 16bit PROM_DATA. At the same time, the next PROM_ADDR is shifted into the external shift register.
- 5** SPLD is asserted for one SPCLK cycle, loading the PROM_ADDR into the external presentation register and the first PROM_DATA into the external shift register.
- 6** SPLD is deasserted for 22 SPCLK cycles, shifting the first PROM_DATA into the network processor internal shift register.

- 7 SPLD is asserted for one SPCLK cycle, loading the first PROM_DATA into the network processor PROM_RETURN_DATA register and the second PROM_DATA into the external shift register.
- 8 SPLD is deasserted for 22 SPCLK cycles, shifting the second PROM_DATA into the network processor internal shift register.
- 9 SPLD is asserted for one SPCLK cycle, loading the second PROM_DATA into the network processor PROM_RETURN_DATA register.

Figure 5 PROM Interface Timing Outline

General System Interface Signal

Table 17 provides the signal for the Executive Processor reset power status and I/O clock. The C-5 NP can be powered up with the XP either running or with the XP in reset mode similar to the CPs. When the XP remains in reset mode, an external host can be used to control the initialization of the C-5 NP.

Table 17 General System Interface Signal

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
XPUHOT	J19	1	LVTTL	I	Sample at Power On Reset determines if the XP RISC Core is held in reset. Low equals reset and High equals active. During normal operation, this is an external interrupt.
TOTAL PINS		1			

Fabric Processor Interface Signals

- The FP consists of two logical signal interfaces: a receive data interface and a transmit data interface, each with its own control and clocking signals. The interface has the following characteristics:
- The interface clocks FRXCLK and FTXCLK can have a different frequency from the core C-5 NP clock frequency. The Fabric Data Processor (FDP) has synchronizing FIFOs at its interface boundary to allow for a fabric interface frequency from 10MHz to 110MHz.
 - The receive clock FRXCLK and the transmit clock FTXCLK must share the same frequency. The synchronization logic internal to the FP requires related clock domains on the transmit and receive interfaces. Each of the two clocks can have different phase alignment, however, because they are generated externally.

Each data bus can be run at widths of 16 or 32 bits of data (FIN0 - FIN31 and FOUT0 - FOUT31) per clock. The extra data pins in each configuration remain unused. The output pins are driven to a known state, and the input pins should also be pulled to a known state.

Table 18 Fabric Interface Signals

BMU SDRAM Interface Signals

The BMU and SDRAM interface signals are described in [Table 23](#).

The BMU is designed to support SDRAM devices with 12 address lines. All 139 data lines and all 12 address lines must be connected to the SDRAM in order for the BMU to be able to read and write external SDRAM properly.

Table 23 BMU SDRAM Interface Signals

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION

MDECC0 - MDECC8	G16, F15, F14, E14, D15, D14, C14, B14, A14	9	LVTTL	I/O	Stored as data, ECC bits

Table 23 BMU SDRAM Interface Signals (continued)

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
MA0 - MA11	H22, I22, H23, H24, I24, H25, H26, I26, H27, H28, I28, H29	12	LVTTTL	O	Address Outputs: A0-A11 are sampled during the ACTIVE command and READ/WRITE to select one location out of the memory array in the respective bank. The address inputs also provide the op-code during a LOAD MODE REGISTER command
MBA0 - MBA1	G18, H19	2	LVTTTL	O	Bank Address Outputs: BA0 and BA1 define which bank the ACTIVE, READ, WRITE or PRECHARGE command is being applied
MCLK	I16	1	nc	nc	Reserved
MCASX	J21	1	LVTTTL	O	Command Outputs: MRASX, MCASX, MWEX and MCSX define the command being entered. <i>NOTE: MCSX is considered part of the command code.</i>
MRASX	I20	1	LVTTTL	O	Command Outputs: MRASX, MCASX, MWEX and MCSX define the command being entered. MCSX is considered part of the command code.
MWEX	J20	1	LVTTTL	O	Command Outputs: MRASX, MCASX, MWEX and MCSX define the command being entered. MCSX is considered part of the command code.
MCSX	H20	1	LVTTTL	O	Chip Select: MCSX enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when MCSX is registered HIGH. MCSX provides the external bank selection on systems with multiple banks. MCSX is considered part of the command code.
MDQM MDQML	H21 G14	1 1	LVTTTL LVTTTL	O O	Input/Output Mask: MDQM is an input mask signal for write accesses and an output enable signal for read accesses. Input data is masked when MDQM is sampled HIGH during a WRITE cycle. The output buffers are placed in a high Z state (two-clock latency) when MDQM is sampled HIGH during the READ cycle. <i>NOTE: MDQML is an identical copy of MDQM used to drive the loading on SDRAM configurations with 2 DQM pins.</i>

Table 23 BMU SDRAM Interface Signals (continued)

SIGNAL NAME	PIN #	TOTAL	TYPE	I/O	SIGNAL DESCRIPTION
MDCLK	J17	1	LVTTL	I	Clock: MDCLK is driven by the system clock. All SDRAM input signals are sampled on the positive edge of the MDCLK. MDCLK also increments the internal burst counter and controls the output registers.
TOTAL PINS		161			

TLU SRAM Interface Signals

The TLU SRAM interface supports up to 32MBytes of SRAM at frequencies to 133MHz using LVTTL signaling levels (in single bank-mode only) and SRAM technologies up to 64Mbits. The TLU SRAM interface signals are described in [Table 24](#).

Table 24 TLU SRAM Interface Signals

JTAG Support

The C-5 NP contains JTAG test logic compliant with the IEEE 1149.1 specification. All required public instructions are implemented, as well as some optional instructions. This section contains information regarding the pinout, instructions, identification codes, and boundary scan cell types.

Pinout

The C-5 NP uses the standard JTAG pins including the optional test reset pin. [Table 28](#) describes the pins and their functions. Note that pins for JTRSTX, JTDI, and JTMS require external pullups on the board. These ports do not have internal pullups as required by the 1149.1 specification.

JTAG Data Registers The C-5 NP contains the standard internal registers as specified in IEEE 1149.1. These registers are described in [Table 31](#).

Table 31 JTAG Internal Register Descriptions

REGISTER NAME	REGISTER LENGTH	DESCRIPTION
Bypass	1	Standard JTAG bypass register
Boundary	1807	Boundary Scan Register
Device Identification	32	Standard JTAG IDCODE Register

Boundary Scan Cell Types The C-5 NP boundary scan register contains only two cell types. All input cells are *observe only* cells of type BC_4. All enable and output cells are standard cells of type BC_1. In IEEE 1149.1-1990 specification, the BC_4 cell is shown in [Figure 7](#) and the BC_1 cell is shown in [Figure 8](#).

Figure 7 Observe-Only Cell

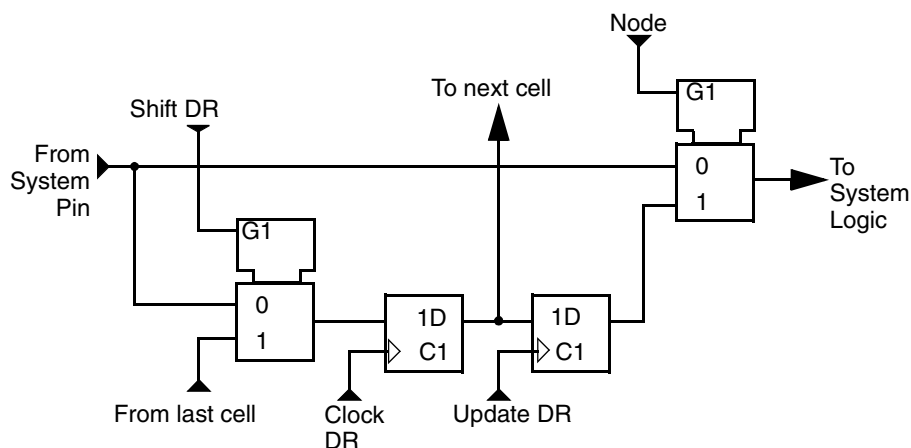

Figure 8 Cell Design That Can Be Used for Both Input and Output Pins**IDcode Register**

The C-5 NP implements a standard 32bit JTAG identification register. [Table 32](#) lists the value of the code for full identification and its sub-components.

Table 32 JTAG Identification Code and Its Sub-components

FIELD NAME	WIDTH	BIT POSITIONS	BINARY VALUE
Version	4	31-28	0000
Part Number	16	27-12	0000_0000_0000_0010
Manufacturer Identity	11	11-1	001_1001_0110
LSB	1	0	1

The concatenated 32bit value is hexadecimal 0000232d.

JTAG Instruction Register

The C-5 NP contains a 4bit instruction register. [Table 33](#) lists the instructions that are supported.

Table 33 Instruction Register Instructions

INSTRUCTION MNEMONIC	SELECTED REGISTER	INSTRUCTION OPCODE
Extest	Boundary Scan	0000
Idcode	Identification Register	0001

Table 33 Instruction Register Instructions (continued) (continued)

INSTRUCTION MNEMONIC	SELECTED REGISTER	INSTRUCTION OPCODE

Highz	Bypass Register	0011
Clamp	Bypass Register	0100
Bypass	Bypass Register	0101
Reserved*	Bypass Register	0110
Reserved*	Bypass Register	0111
Bypass	Bypass Register	1000
Bypass	Bypass Register	1001
Bypass	Bypass Register	1010
Bypass	Bypass Register	1011
Bypass	Bypass Register	1100
Bypass	Bypass Register	1101
Bypass	Bypass Register	1110
Bypass	Bypass Register	1111

* There are two reserved instructions intended for C-Port Corporation’s internal use. These should not be programmed by users.

***Boundary Scan
Description Language***

In order to simplify board test, C-Port Corporation has provided a boundary scan description language (BSDL) file in the C-Port web site support area that describes the complete set of instructions, boundary scan order, and identification code value in an industry standard format. This information can be found at:
<http://e-www.motorola.com/webapp/sps/site/homepage.jsp?nodeId=03M0ylgx1Ks>.

ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings

Table 34 lists the absolute maximum ratings for the C-5 network processor. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and do not imply that operation under any conditions other than those listed under “Recommended Operating Conditions” (Table 35) is possible.

Exposure to conditions beyond Table 34 can:

- Reduce device reliability
- Result in premature device failure, even with no immediate sign of failure

Prolonged exposure to conditions at or near the absolute maximum ratings could also result in reduced useful life and reliability of the C-5 NP.

Table 34 C-5 Network Processor Absolute Maximum Ratings

PARAMETER	MIN	MAX	UNIT
V _{DD33} Supply Voltage (3.3V input)*†	-0.5	+5	V
V _{DD} Supply Voltage (1.8V input)*	-0.5	+2.8	V
Voltage on any pin	-0.5	V _{DD33} + 0.5	V
Static Discharge Voltage	2000/500		V
Storage Temperature	-40	+125	°C
Absolute Maximum Junction Temperature	-40	+125	°C

* Voltages are relative to Ground

† Not to exceed V_{DD} + 2.5V

Recommended Operating Conditions

The recommended operating conditions describe an environment the C-5 NP network processor is expected to encounter during normal operation. [Table 35](#) delineates the recommended operating parameters for the C-5 NP.

Table 35 C-5 Network Processor Recommended Operating Conditions

PARAMETER	MIN	MAX	UNIT
V _{DD33} Supply Voltage	3.135	3.465	V
V _{DD} Supply Voltage	1.7	1.9	V
I _{DD33} - V _{DD33} Supply Current		1.5*	A
I _{DD} - V _{DD} Supply Current		14*	A
T _j Junction Temperature	-40	100	°C

* Peak values to be used by power supply designer.

DC Characteristics

The DC electrical characteristics define the input operating conditions for proper operation and the output responses to applied DC signals and switch characteristics over specified voltage and temperature ranges. The DC electrical characteristics are specified within the *recommended operating conditions* including operating temperature and power supply range as stated in this data sheet. [Table 36](#) outlines the C-5 NP DC characteristics.

Table 36 C-5 Network Processor DC Characteristics

PARAMETER*	MIN	MAX	UNIT	NOTES
LVTTL Input High Voltage	2.0	V _{DD33} + .3	V	
LVTTL Input Low Voltage	-0.3	0.8	V	
LVTTL Output High Voltage	2.4		V	@I _{OH} = -2mA
LVTTL Output Low Voltage		0.4	V	@I _{OL} = +2mA
LVTTL Input Current	-5	+5	μA	V _{IN} = 0V or V _{DD33}
LVPECL Input High Voltage	V _{DD33} -1.165	V _{DD33} + .3V	V	
LVPECL Input Low Voltage	-0.3	V _{DD33} -1.475	V	
LVPECL Output High Voltage	V _{DD33} -1.025	V _{DD33} -0.880	V	Load = 50ohm to V _{DD33} - 2V

Table 36 C-5 Network Processor DC Characteristics (continued) (continued)

PARAMETER*	MIN	MAX	UNIT	NOTES
LVPECL Output Low Voltage	$V_{DD33} - 1.810$	$V_{DD33} - 1.620$	V	Load = 50ohm to $V_{DD33} - 2V$
LVPECL Input Current	-5	+5	μA	
CPREF	$V_{DD33} - 1.38$	$V_{DD33} - 1.26$	V	Single-ended LVPECL reference

* All voltages are relative to Ground unless otherwise indicated.

Each control input pin has a capacitance associated with it. The capacitance at the control input is due to the package and the input circuitry connected to the pin. Capacitance is based on these conditions: $T_A = 25^\circ C$; $V_{DD33} = 3.3V$; $f = 1MHz$. [Table 37](#) provides capacitance data.

Table 37 C-5 Network Processor Capacitance Data

PARAMETER	TYPICAL	MAX	UNIT
Input/Output Pins	7	8	pF
Input Pins	6	7	pF
Clock Pins	6	7	pF

Power Sequencing

The VDD rail must be kept within 2.5V of the VDD33 rail. However, this rule can be violated for periods up to one second, as is typical during power sequencing, as long as:

- The VDD is not clamped to ground or some other low voltage.
- The number of power cycling events averages to less than once per day over the lifetime of the product.

It is intended that the VDD and VDD33 rail be sequenced to their final value together for most applications.

It is also required that SCLK, SCLKX, TCLKI, PCLK, MDCLK, FTXCLK, and FRXCLK be running or begin running during power sequencing to propagate reset inside the C-5 NP. [Figure 9](#) indicates the relationship between the clocks and PRSTX. There is no requirement that the asserting and deasserting edges of PRSTX be synchronous to the clocks. Reset must be asserted within 100 μs of power initiation. Typically, reset is held low during power initiation.

Figure 9 Bringup Clock Timing Diagram

Power and Thermal Characteristics

Table 38 provides the derived power and thermal characteristics for the production version (Revision D0) of the C-5 NP.

Table 38 C-5 Network Processor Power and Thermal Characteristics

PARAMETER	MIN	TYP	MAX	UNITS	TEST CONDITIONS
Power Dissipation, P_D	10.5	15.0	18.0	W	166MHz core clock (See Note 1)
	11.5	16.0	19.0		180MHz core clock (See Note 1)
	12.5	17.5	20.5		200MHz core clock (See Note 1)
	14.5	20.0	23.0		233MHz core clock (See Note 1)
Maximum Junction Temperature, T_j			100	$^{\circ}\text{C}$	
Thermal Resistance, junction to case, ϕ_{JC}		0.24		$^{\circ}\text{C}/\text{W}$	See Note 2
Thermal Resistance, junction to ambient, ϕ_{JA}		1.87		$^{\circ}\text{C}/\text{W}$	See Note 2
Thermal Resistance, junction to printed circuit board, ϕ_{JB}		4.8		$^{\circ}\text{C}/\text{W}$	See Note 2

Table 38 C-5 Network Processor Power and Thermal Characteristics (continued)

PARAMETER	MIN	TYP	MAX	UNITS	TEST CONDITIONS
Thermal Resistance, Junction through Board to Ambient, ϕ_{JBA}		6.0			See Note 2
Effective Thermal Resistance, $\phi_{\text{effective}}$		1.43		°C/W	See Note 3

Notes for [Table 38](#):

- Estimated power dissipation (+/-10%) is derived from measurements on the C-5 NP Revision D00 under following conditions:
 - BMU memory operating at 125MHz.
 - TLU memory operating at 133MHz.
 - $V_{DD} = 1.8V$, $V_{DD33} = 3.3V$, T_J at approximately 50°C.
 - “Minimum” P_D based on idle condition (clocks running and no programs executing).
 - “Typical” P_D based on test application that implements Fast Ethernet forwarding actively running on all CPs.
 - “Maximum” P_D based on projected maximum consumption for any high-bandwidth communications application executing on all CPs, FP, and XP.
- Thermal performance specifications based on following conditions:
 - Printed circuit board is based on the C-Ware Development System’s C-5 NP Switch Module reference design, with specifications of:
 - 14 total layers (5 planes). Planes at least 100mm x 100mm below the C-5 NP before any interruptions.
 - FR4 board material, Cu signal and plane material.
 - 0.5mils signal layer thickness, 1.4mils plane layer thickness.
 - Thermal resistance, board to ambient (ϕ_{BA}) of 1.2 °C/W.
 - Custom heat sink design has the following characteristics:

- Dimensions: 100mm x 80mm x 10mm (height)
- Thermal resistance heat sink to ambient (ϕ_{SA}) of 1.6 °C/W @200 LFM. **Figure 10** provides the characteristic thermal resistance curve for this heat sink for various airflow rates.
- Thermal resistance case to heat sink (ϕ_{CS}) of 0.03 °C/W (Chromerics T705 thermal material).
- Note that target heat sink design is for low profile (10mm height) applications. Significantly better thermal performance is possible with taller and/or wider designs. Contact your C-Port representative for heat sink options.

3 Effective Thermal Resistance ($\phi_{\text{effective}} = \phi_{JA} \phi_{JBA} / (\phi_{JA} + \phi_{JBA})$) reflects the total thermal performance of the heat sink and board, as outlined in Note 2 above.

Figure 10 Thermal Performance for C-5 Network Processor Heat Sink (see [step 2](#) above)

Theoretical calculation of thermal resistance as a function of airflow velocity across heat sink

AC Timing Specifications

AC timing specifications consist of input requirements and output responses. The input requirements include setup and hold times, pulse widths, and high and low times. The output responses include delays from clock to signal. The AC timing specifications are defined separately for each interface to the C-5 NP

Unless otherwise noted, all AC specifications were tested within the functional operating range.

See [Figure 11](#). Output timing specifications for LVTTTL pins are given with a 10pF load on the output. Other loads can be simulated with the IBIS model available from C-Port. The LVPECL driver is specified into a 50Ω load terminated to a (VDD33 - 2V) reference.

Figure 11 Test Loading Conditions

Clock Timing Specifications

The system clock timing is shown in [Figure 12](#) and described in [Table 39](#).

Figure 12 System Clock Timing Diagram

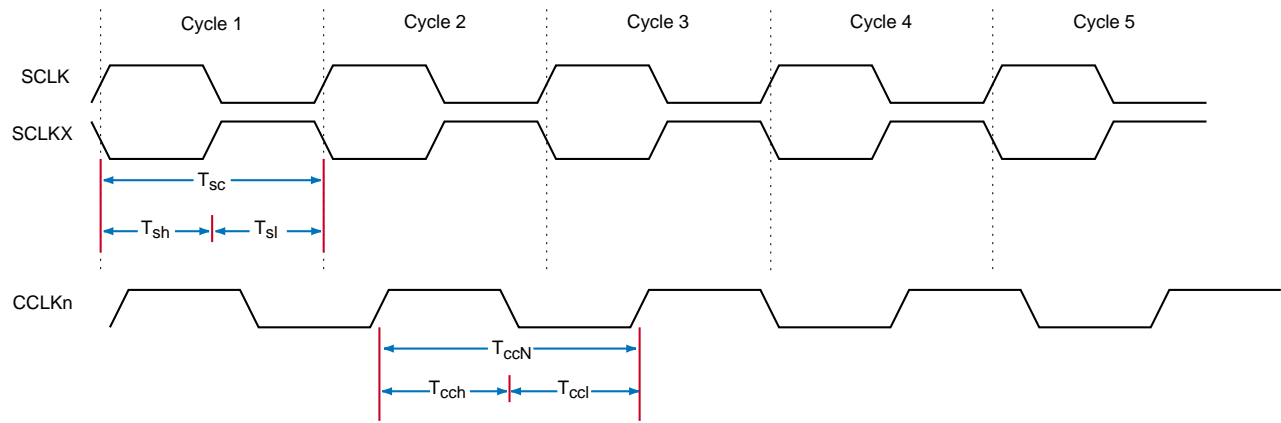

Table 39 System Clock Timing Description

SYMBOL	PARAMETER	MIN		TYP	MAX		UNIT	COMMENT
		1X CLK MODE	2X CLK MODE		1X CLK MODE	2X CLK MODE		
Tsc	System Cycle Time	6.0 5.0 4.3	3.0 2.5 2.14				ns	166MHz core clock 200MHz core clock 233MHz core clock
Tsh	Sys Clk High Pulse	45	30		55	70		Duty cycle*
Tsl	Sys Clk Low Pulse	45	30		55	70		Duty cycle†
Tcc0	CCLK0 Cycle Time			647.67			ns	T1†
Tcc1	CCLK1 Cycle Time			488.28			ns	E1†
Tcc2	CCLK2 Cycle Time			29.097			ns	E3†
Tcc3	CCLK3 Cycle Time			22.353			ns	T3†
Tcc4	CCLK4 Cycle Time			20.00			ns	RMII†
Tcc5	CCLK5 Cycle Time			9.412			ns	Fibre Channel†
Tcc6	CCLK6 Cycle Time			8.00			ns	GMII†
Tcc7	CCLK7 Cycle Time			6.43			ns	OC-3†
Tcch	CCLKm High Time	40%	40%		60%	60%		% cycle pulse is high
Tccl	CCLKm Low Time	40%	40%		60%	60%		% cycle pulse is low

* Pulse duty cycle measured at crossing voltage of SCLK/SCLKX

† The frequencies specified for CCLK0 - CCLK7 allow full flexibility for the C-5 NP . Clock inputs associated with a specific protocol should be tied to ground when that protocol is not used by the C-5 NP . It is also possible to use one or more CCLKn inputs for other frequencies; contact your C-Port representative for more information.

Unused clocks should be pulled to a known state (ground) through a resistor. If you are using a clock generator, disabling the output should not cause a tristate. If it does, then the line should be pulled down.

CP Timing Specifications This section describes the timing for the following CP interfaces:

- [DS1/DS3 Ethernet Timing Description](#)
- [10/100 Ethernet Timing Description](#)
- [Gigabit GMII/MII Ethernet Interface Timing Description](#)
- [OC-3 Timing Description](#)

- [Gigabit TBI Interface Timing Description](#)
- [OC-12 Timing Description](#)

DS1/DS3 Timing Specifications

The DS1/DS3 interface timing is shown in [Figure 13](#) and described in [Table 40](#).

Figure 13 DS1/DS3 Ethernet Timing Diagram

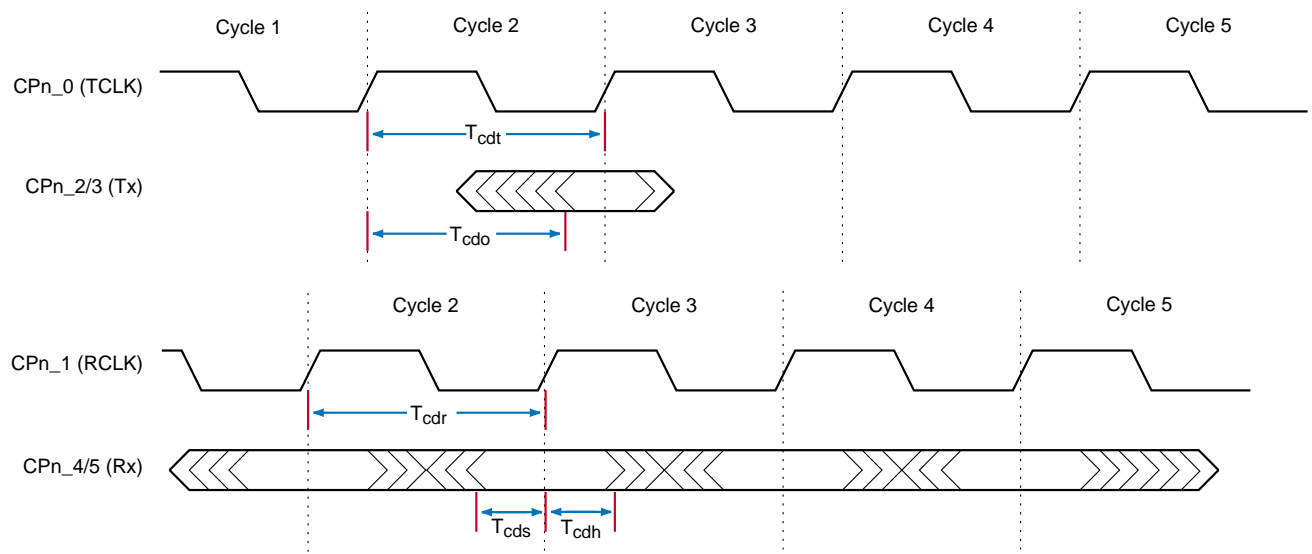

Table 40 DS1/DS3 Ethernet Timing Description

SYMBOL	PARAMETER	MIN	TYP	MAX	UNIT
Tcdt	DS1/DS3 Transmit Cycle Time		647/22.4		ns
Tcdo	DS1/DS3 Output Time	3.0/3.0		400/15.0	ns
Tcdr	DS1/DS3 Receive Cycle Time		647/22.4		ns
Tcds	DS1/DS3 Setup Time	2.0			ns
Tcdh	DS1/DS3 Hold Time	2.5			ns

10/100 Ethernet Timing Specifications

The 10/100 Ethernet interface timing is shown in [Figure 14](#) and described in [Table 41](#).

Figure 14 10/100 Ethernet Timing Diagram

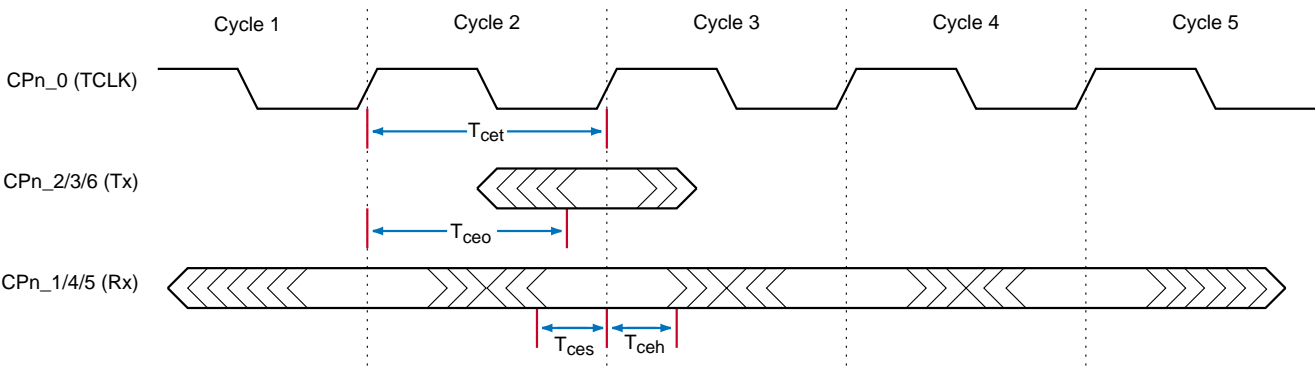

Table 41 10/100 Ethernet Timing Description

* Not fully tested, values based on design/characterization.

BMU Timing Specifications

The BMU timing specifications are shown in [Figure 23](#) and described in [Table 51](#).

The BMU synchronous DRAM interface is PC100-compliant and designed to work with industry standard SDRAM components with 12 or fewer address lines. The information below is intended to provide the output, setup, and hold data required to design this interface without duplicating the transaction waveform diagrams in SDRAM data sheets.

Figure 23 BMU Timing Diagram

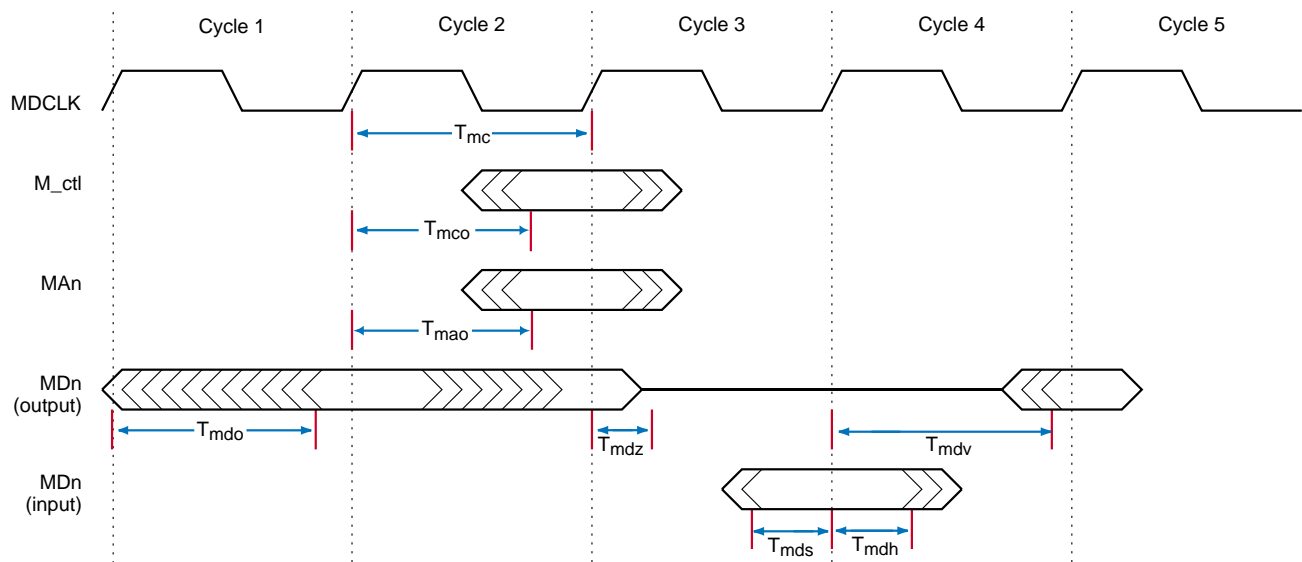

Table 51 BMU Timing Description

SYMBOL	PARAMETER	MIN	TYP	MAX	UNIT
Tmc	BMU Cycle Time	8.0			ns
Tmco	BMU Ctrl Output	1.2		3.7	ns
Tmao	BMU Addr Output	1.2		3.8	ns
Tmds	BMU Data Setup	0.5			ns
Tmdh	BMU Data Hold	1.0			ns
Tmdo	BMU Data Output	1.2		4.0	ns
Tmdz	BMU Data Clk to Tri*	1.8		4.0	ns
Tmdv	BMU Data Clk to Driven*	1.4		4.0	ns

* Not fully tested, values based on design/characterization.

MECHANICAL SPECIFICATIONS

Package Views

The C-5 network processor is an 838 pin (29 pins x 29 pins) Ball Grid Array (BGA) package as shown in the following illustrations. [Table 57](#) defines the package measurements.

Figure 26 C-5 Network Processor BGA Package Side View

HiTCE: Green ceramic is thermally matched to FR4 circuit board.

The aluminum lid is electrically connected to the grounded substrate of the C-5 NP. Neither the lid nor any heat sink connected to the lid should be part of a current-carrying path. It is acceptable, however, to connect the lid or heatsink to ground if necessary (through the standoff screws for the heat sink).

Figure 27 C-5 Network Processor BGA Package (Bottom View)

Package Measurements

Table 57 defines the C-5 NP package measurements, providing nominal, minimum, and maximum sizes where appropriate.

Table 57 Package Measurements (Reference [Figure 26](#) and [Figure 27](#) for Symbols)

SYMBOL	DEFINITION	NOM. (MM)	MIN. (MM)	MAX. (MM)
A	Overall	5.63	5.31	5.95
A ₁	Ball height	0.89		
A ₂	C4 and Die	0.88		
A ₃	Body thickness	2.26	2.07	2.53
A ₄	Lid thickness	1.6		
D	Body size	37.50		
D ₁	Ball footprint (X)	35.56		
E	Body size	37.50		
E ₁	Ball footprint (Y)	35.56		
e	Ball pitch	1.27		
b	Ball diameter	0.89		

Marking Codes

[Table 58](#) explains the marking on the C-5 NP.

Table 58 C-5 Network Processor Marking Codes

MARKING (EXPLANATION OF CODES)	
Top	Logo/Part#/Country of Origin/Date Code
Bottom	N/A
Pin 1 Marking	Chamfered Corner

Reflow

Typical Reflow Profile for the C-5 Switch Module

1 Follow the guidelines recommended by your solder paste supplier.

Flux requirements must be met for best solderability.

2 The temperature profile should be carefully characterized to ensure uniform temperature across the board and package.

Solder ball voiding may be affected by ramp rates and dwell times below and above liquidus.

- 3 A nitrogen atmosphere is not required, but will make the process more robust. It can make a difference for marginally solderable PC board pads.
- 4 Full convection forced air furnaces work best, but IR, Convection/IR, or vapor phase can be used.
