Monolithic PCM Repeater

Features

- Automatic Line Buildout
- Supply Voltage 5.1V
- Buffered Output

Applications

- Bipolar Carrier System T1 1.544Mbits/s
- Ternary Carrier System T148 2.37Mbits/s

Description

The CD22301 monolithic PCM repeater circuit is designed for T1 carrier systems operating with a bipolar pulse train of 1.544Mbits/s. It can also be used in the T148 carrier system operating with a ternary pulse train of 2.37Mbits/s. The circuit operates from a 5.1V $\pm 5\%$ externally regulated supply.

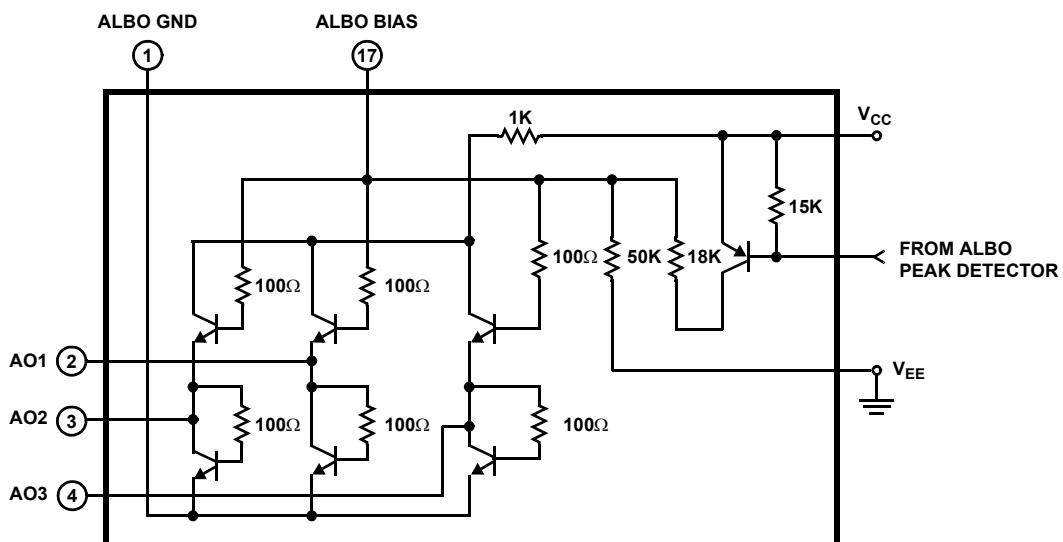

The CD22301 provides active circuitry to perform all functions of signal equalization and amplification, automatic line buildup (ALBO), threshold detection, clock extraction, pulse timing and buffered output formation.

Absolute Maximum Ratings

Supply Voltage	10V
Input Current (Into Pin 9 or 10).....	25mA
Peak Current (Into Pin 9 or 10).....	100mA
Input Surge Voltage (Between Pins 5 and 6, t = 10ms).....	50V
Output Surge Voltage (Between Pins 10 and 11, t = 1ms).....	50V

Power Dissipation

For $T_A = -40^\circ\text{C}$ to 60°C	500mW
For $T_A = 60^\circ\text{C}$ to 85°C	Derate Linearly 12mW/ $^\circ\text{C}$ to 200mW

Device Dissipation per Output Transistor

For T_A = Full Package Temperature Range (All Types).....	100mW

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Thermal Information

Maximum Junction Temperature.....	175°C
Maximum Junction Temperature (Plastic Package)	150°C
Maximum Storage Temperature Range	$-65^\circ\text{C} \leq T_A \leq 150^\circ\text{C}$
Maximum Lead Temperature (Soldering 10s).....	300°C

NOTES:

1. No signal input. Measure voltage between pins 7 and 8.
2. Measure clock limiter input impedance at pin 15. See Figure 5.
3. Adjust potentiometer for 0V (See Figure 5). Measure ALBO off impedances from pins 2, 3 and 4 to pin 1.
4. Increase potentiometer until voltage at pin 17 = 2V (See Figure 5). Measure ALBO on impedances from pins 2, 3 and 4 to pin 1.
5. Adjust potentiometer for $\Delta V = 0\text{V}$ (See Figure 6). Then slowly increase ΔV in the positive direction until pulses are observed at the DATA terminal.
6. Continue increasing ΔV until the DC level at the clock terminal drops to 4V (See Figure 6).
7. Continue increasing ΔV until the ALBO terminal rises to 1V (See Figure 6).
8. Turn potentiometer in the opposite direction and measure negative threshold voltages by repeating tests outlined in notes 5, 6 and 7.
9. Set $e_{IN} = 2.75\text{mV}_{\text{RMS}}$ at $f \approx 1.185\text{MHz}$. Adjust frequency until maximum amplitude is obtained at pin 15. Observe output pulses at pins 10 and 11.
10. Adjust input signal amplitude until pulses just appear in outputs. Increase input amplitude by 3dB.
