

# CD4014BM/CD4014BC 8-Stage Static Shift Register

## General Description

The CD4014BM/CD4014BC is an 8-stage parallel input/serial output shift register. A parallel/serial control input enables individual JAM inputs to each of 8 stages. Q outputs are available from the sixth, seventh and eighth stages. All outputs have equal source and sink current capabilities and conform to standard "B" series output drive.

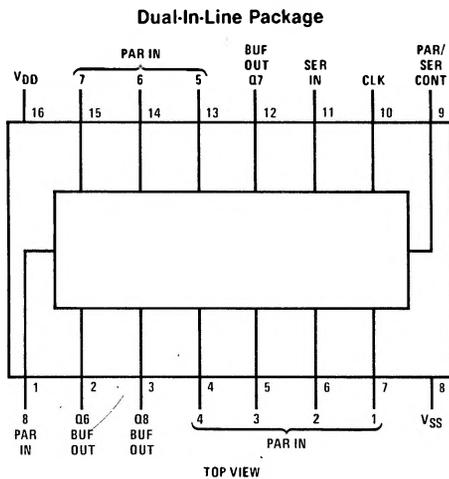

When the parallel/serial control input is in the logical "0" state, data is serially shifted into the register synchronously with the positive transition of the clock. When the parallel/serial control input is in the logical "1" state, data is jammed into each stage of the register synchronously with the positive transition of the clock.

All inputs are protected against static discharge with diodes to  $V_{DD}$  and  $V_{SS}$ .

## Features

- Wide supply voltage range—3.0V to 15V
- High noise immunity— $0.45 V_{DD}$  (typ.)
- Low power TTL compatibility — fan out of 2 driving 74L or 1 driving 74LS
- 5V-10V-15V parametric ratings
- Symmetrical output characteristics
- Maximum input leakage  $1 \mu A$  at 15V over full temperature range

**Note 1:** "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

**Note 2:**  $V_{SS} = 0\text{V}$  unless otherwise specified.

**Note 3:** If more than one unit is cascaded  $t_{rCL}$  should be made less than or equal to the fixed propagation delay of the output of the driving stage for the estimated capacitive load.

**Note 4:**  $C_{PD}$  determines the no load AC power consumption of any CMOS device. For complete explanation, see 54C/74C family characteristics application note AN-90.

**Note 5:** Set-up times are measured with reference to clock and a fixed hold time ( $t_H$ ) as specified.
