

CLC425 Ultra Low Noise Wideband Op Amp

Check for Samples: [CLC425](#)

FEATURES

- 1.9GHz gain-bandwidth product
- $1.05\text{nV}/\sqrt{\text{Hz}}$ input voltage noise
- $0.8\text{pA}/\sqrt{\text{Hz}}$ @ $I_{\text{CC}} \leq 5\text{mA}$
- $100\mu\text{V}$ input offset voltage, $2\mu\text{V}/^\circ\text{C}$ drift
- $350\text{V}/\mu\text{s}$ slew rate
- 15mA to 5mA adjustable supply current
- Gain range ± 10 to $\pm 1,000\text{V/V}$
- Evaluation boards & simulation macromodel
- 0.9dB NF @ $R_s = 700\Omega$

APPLICATIONS

- Instrumentation sense amplifiers
- Ultrasound pre-amps
- Magnetic tape & disk pre-amps
- Photo diode transimpedance amplifiers
- Wide band active filters
- Low noise figure RF amplifiers
- Professional audio systems
- Low noise loop filters for PLLs

Figure 1. Equivalent Input Voltage Noise

DESCRIPTION

The CLC425 combines a wide bandwidth (**1.9GBW**) with a very low input noise ($1.05\text{nV}/\sqrt{\text{Hz}}$, $1.6\text{pA}/\sqrt{\text{Hz}}$) and low dc errors ($100\mu\text{V}$ V_{OS} , $2\mu\text{V}/^\circ\text{C}$ drift) to provide a very precise, wide dynamic range op amp offering closed-loop gains of ≥ 10 .

Singularly suited for very wideband high gain operation, the CLC425 employs a traditional voltage feedback topology providing all the benefits of balanced inputs, such as low offsets and drifts, as well as a 96dB open loop gain, a 100dB CMRR and a 95dB PSRR.

The CLC425 also offers great flexibility with its externally adjustable supply current, allowing designers to easily choose the optimum set of power, bandwidth, noise and distortion performance. Operating from $\pm 5\text{V}$ power supplies, the CLC425 defaults to a 15mA quiescent current, or by adding one external resistor, the supply current can be adjusted to less than 5mA.

The CLC425's combination of ultra low noise, wide gain bandwidth, high slew rate and low dc errors will enable applications in areas such as medical diagnostic ultrasound, magnetic tape & disk storage, communications and opto-electronics to achieve maximum high frequency signal-to-noise ratios.

Enhanced Solutions (Military/Aerospace)

Application Division

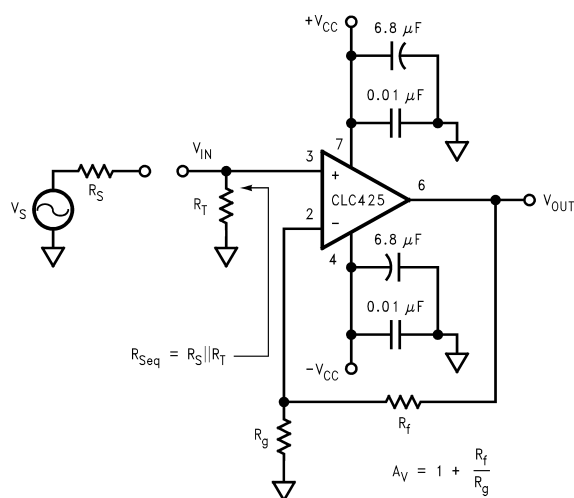

Figure 4. Non-Inverting Amplifier Configuration

Introduction

The CLC425 is a very wide gain bandwidth, ultra low noise voltage feedback operational amplifier which enables application areas such as medical diagnostic ultrasound, magnetic tape & disk storage and fiber-optics to achieve maximum high frequency signal-to-noise ratios. The set of characteristic plots located in the "Typical Performance" section illustrates many of the performance trade offs. The following discussion will enable the proper selection of external components in order to achieve optimum device performance.

Bias Current Cancellation

In order to cancel the bias current errors of the non-inverting configuration, the parallel combination of the gain setting (R_g) and feedback (R_f) resistors should equal the equivalent source resistance (R_{Seq}) as defined in Figure 4. Combining this constraint with the non-inverting gain equation also seen in Figure 4, allows both R_f and R_g to be determined explicitly from the following equations:

$$R_f = A_V R_{Seq} \text{ and } R_g = R_f / (A_V - 1).$$

When driven from a 0Ω source, such as that from the output of an op amp, the non-inverting input of the CLC425 should be isolated with at least a 25Ω series resistor.

As seen in Figure 5, bias current cancellation is accomplished for the inverting configuration by placing a resistor (R_b) on the non-inverting input equal in value to the resistance seen by the inverting input ($R_f \parallel (R_g + R_s)$). R_b is recommended to be no less than 25Ω for best CLC425 performance. The additional noise contribution of R_b can be minimized through the use of a shunt capacitor.

Figure 5. Inverting Amplifier Configuration

Total Input Noise vs. Source Resistance

In order to determine maximum signal-to-noise ratios from the CLC425, an understanding of the interaction between the amplifier's intrinsic noise sources and the noise arising from its external resistors is necessary.

Figure 6 describes the noise model for the non-inverting amplifier configuration showing all noise sources. In addition to the intrinsic input voltage noise (e_n) and current noise ($i_n = i_{n+} = i_{n-}$) sources, there also exists thermal voltage noise

$$(e_t = \sqrt{Hz} 4kTR)$$

associated with each of the external resistors. Equation 1 provides the general form for total equivalent input voltage noise density (e_{ni}). Equation 2 is a simplification of Equation 1 that assumes

Figure 6. Non-inverting Amplifier Noise Model

$$e_{ni} = \sqrt{e_n^2 + (i_{n+} R_{Seq})^2 + 4kTR_{Seq} + (i_{n-} (R_f \parallel R_g))^2 + 4kT(R_f \parallel R_g)} \quad (1)$$

$R_f \parallel R_g = R_{Seq}$ for bias current cancellation. Figure 7 illustrates the equivalent noise model using this assumption. Figure 8 is a plot of e_{ni} against equivalent source resistance (R_{Seq}) with all of the contributing voltage noise source of Equation 2 shown. This plot gives the expected e_{ni} for a given (R_{Seq}) which assumes $R_f \parallel R_g = R_{Seq}$ for bias current cancellation. The total equivalent output voltage noise (e_{no}) is $e_{ni} \cdot A_V$.

Figure 7. Noise Model with $R_f || R_g = R_{seq}$

$$e_{ni} = \sqrt{e_n^2 + 2(i_n R_{Seq})^2 + 4kT(2R_{Seq})} \quad (2)$$

As seen in Figure 8, e_{ni} is dominated by the intrinsic voltage noise (e_n) of the amplifier for equivalent source resistances below 33.5Ω . Between 33.5Ω and $6.43k\Omega$, e_{ni} is dominated by the thermal noise ($e_t = \sqrt{Hz 4kTR_{seq}}$) of the external resistor. Above $6.43k\Omega$, e_{ni} is dominated by the amplifier's current noise ($\sqrt{Hz} 2i_n R_{seq}$). The point at which the CLC425's voltage noise and current noise contribute equally occurs for $R_{seq} = 464\Omega$ (i.e., $e_n / \sqrt{Hz} 2i_n$). As an example, configured with a gain of $+20V/V$ giving a $-3dB$ of $90MHz$ and driven from an $R_{seq} = 25\Omega$, the CLC425 produces a total equivalent input noise voltage ($e_{ni} \times \sqrt{Hz} 1.57 \times 90MHz$) of $16.5\mu V_{rms}$.

Figure 8. Voltage Noise Density vs. Source Resistance

If bias current cancellation is not a requirement, then $R_f || R_g$ does not need to equal R_{seq} . In this case, according to Equation 1, $R_f R_g$ should be as low as possible in order to minimize noise. Results similar to Equation 1 are obtained for the inverting configuration of Figure 5 if R_{seq} is replaced by R_b and R_g is replaced by $R_g + R_s$. With these substitutions, Equation 1 will yield an e_{ni} referred to the non-inverting input. Referring e_{ni} to the inverting input is easily accomplished by multiplying e_{ni} by the ratio of non-inverting to inverting gains.

Noise Figure

Noise Figure (NF) is a measure of the noise degradation caused by an amplifier.

$$NF = 10 \log \left\{ \frac{S_i / N_i}{S_o / N_o} \right\} = 10 \log \left\{ \frac{e_{ni}^2}{e_t^2} \right\} \quad (3)$$

The Noise Figure formula is shown in Equation 3. The addition of a terminating resistor R_T , reduces the external thermal noise but increases the resulting NF. The NF is increased because R_T reduces the input signal amplitude thus reducing the input SNR.

$$NF = 10 \log \left(\frac{e_n^2 + i_n^2 \left(R_{Seq} + (R_f || R_g)^2 \right) + 4kTR_{Seq} + 4kT(R_f || R_g)}{4kTR_{Seq}} \right) \quad (4)$$

The noise figure is related to the equivalent source resistance (R_{seq}) and the parallel combination of R_f and R_g . To minimize noise figure, the following steps are recommended:

- Minimize $R_f || R_g$

- Choose the Optimum R_S (R_{OPT})

R_{OPT} is the point at which the NF curve reaches a minimum and is approximated by:

$$R_{OPT} \approx e_n / i_n$$

Figure 9 is a plot of NF vs R_S with $R_f R_g = 9.09 (A_v = +10)$. The NF curves for both Unterminated and Terminated systems are shown. The Terminated curve assumes $R_S = R_T$. The table indicates the NF for various source resistances including $R_S = R_{OPT}$.

Figure 9. Noise Figure vs. Source Resistance

Supply Current Adjustment

The CLC425's supply current can be externally adjusted downward from its nominal value by adding an optional resistor (R_p) between pin 8 and the negative supply as shown in Figure 10. Several of the plots found within the plot pages demonstrate the CLC425's behavior at different supply currents. The plot labeled " I_{CC} vs R_p " provides the means for selecting R_p and shows the results of standard IC process variation which is bounded by the 25°C curve.

Figure 10. External Supply Current Adjustment

Non-Inverting Gains Less Than 10V/V

Using the CLC425 at lower non-inverting gains requires external compensation such as the shunt compensation as shown in Figure 11. The quiescent supply current must also be reduced to 5mA with R_p for stability. The compensation capacitors are chosen to reduce frequency response peaking to less than 1dB. The plot in the "Typical Performance" section labeled "differential gain and Phase" shows the video performance of the CLC425 with this compensation circuitry.

Figure 11. External Shunt Compensation

Inverting Gains Less Than 10V/V

The lag compensation of Figure 12 will achieve stability for lower gains. Placing the network between the two input terminals does not affect the closed-loop nor noise gain, but is best used for the inverting configuration because of its affect on the non-inverting input impedance.

Figure 12. External Lag Compensation

Single-Supply Operation

The CLC425 can be operated with single power supply as shown in Figure 13. Both the input and output are capacitively coupled to set the dc operating point.

Figure 13. Single Supply Operation

Low Noise Transimpedance Amplifier

The circuit of Figure 14 implements a low-noise transimpedance amplifier commonly used with photo-diodes. The transimpedance gain is set by R_f . The simulated frequency response is shown in Figure 15 and shows the influence C_f has over gain flatness. Equation 4 provides the total input current noise density (i_{ni}) equation for the basic transimpedance configuration and is plotted against feedback resistance (R_f) showing all contributing noise sources in Figure 16. This plot indicates the expected total equivalent input current noise density (i_{ni}) for a given feedback resistance (R_f). The total equivalent output voltage noise density (e_{no}) is $i_{ni} \cdot R_f$.

Figure 14. Transimpedance Amplifier Configuration

Figure 15. Transimpedance Amplifier Frequency Response

Figure 16. Current Noise Density vs. Feedback Resistance

$$i_{ni} = \sqrt{i_n^2 + \left(\frac{e_n}{R_f}\right)^2 + \frac{4kT}{R_f}} \quad (5)$$

Very Low Noise Figure Amplifier

The circuit of [Figure 17](#) implements a very low Noise Figure amplifier using a step-up transformer combined with a CLC425 and a CLC404. The circuit is configured with a gain of 35.6dB. The circuit achieves measured Noise Figures of less than 2.5dB in the 10-40MHz region, 3rd order intercepts exceed +30dB for frequencies less than 40MHz and gain flatness of 0.5dB is measured in the 1-50MHz passbands. Application Note OA-14 provides greater detail on these low Noise Figure techniques.

Figure 17. Very Noise Figure Amplifier

Low Noise Integrator

The CLC425 implements a deBoo integrator shown in Figure 18. Integration linearity is maintained through positive feedback. The CLC425's low input offset voltage and matched inputs allowing bias current cancellation provide for very precise integration. Stability is maintained through the constraint on the circuit elements.

Figure 18. Low Noise Integrator

High-Gain Sallen-Key Active Filters

The CLC425 is well suited for high gain Sallen-Key type of active filters. Figure 19 shows the 2nd order Sallen-Key low pass filter topology. Using component predistortion methods as discussed in OA-21 enables the proper selection of components for these high-frequency filters.

Figure 19. Sallen-Key Active Filter Topology

Low Noise Magnetic Media Equalizer

The CLC425 implements a high-performance low noise equalizer for such applications as magnetic tape channels as shown in Figure 20. The circuit combines an integrator with a bandpass filter to produce the low noise equalization. The circuit's simulated frequency response is illustrated in Figure 21.

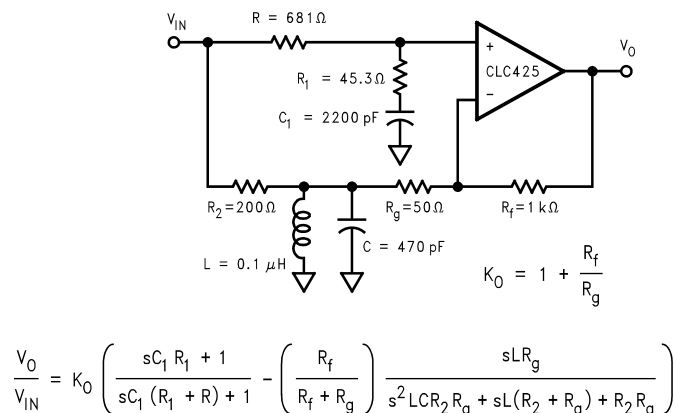

Figure 20. Low Noise Magnetic Media Equalizer

Figure 21. Equalizer Frequency Response

Low-Noise Phase-Locked Loop Filter

The CLC425 is extremely useful as a Phase-Locked Loop filter in such applications as frequency synthesizers and data synchronizers. The circuit of Figure 22 implements one possible PLL filter with the CLC425.

Figure 22. Phase-Locked Loop Filter

Decreasing the Input Noise Voltage

The input noise voltage of the CLC425 can be reduced from its already low $1.05\text{nV}/\sqrt{\text{Hz}}$ by slightly increasing the supply current. Using a $50\text{k}\Omega$ resistor to ground on pin 8, as shown in the circuit of Figure 17, will increase the quiescent current to $\approx 17\text{mA}$ and reduce the input noise voltage to

$$< 0.95\text{nV}/\sqrt{\text{Hz}}$$

Printed Circuit Board Layout

Generally, a good high-frequency layout will keep power supply and ground traces away from the inverting input and output pins. Parasitic capacitances on these nodes to ground will cause frequency response peaking and possible circuit oscillation, see OA-15 for more information. National suggests the CLC730013-DIP, CLC730027-SOIC, or CLC730068-SOT evaluation board as a guide for high frequency layout and as an aid in device testing and characterization.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
