CLC430 General Purpose 100MHz Op Amp with Disable 0.03%/0.05° differential gain/phase **General Description**

The CLC430 is a low cost, wideband monolithic amplifier for general purpose applications. The CLC430 utilizes National's patented current feedback circuit topology to provide an op amp with a slew rate of 2000V/µs, 100MHz unity-gain bandwidth and fast output disable function. Like all current feedback op amps, the CLC430 allows the frequency response to be optimized (or adjusted) by the selection of the feedback resistor. For demanding video applications, the 0.1dB bandwidth to 20MHz and differential gain/phase of 0.03%/0.05° make the CLC430 the preferred component for broadcast quality NTSC and PAL video systems.

National Semiconductor

The large voltage swing (28V_{PP}), continuous output current (85mA) and slew rate (2000V/µs) provide high-fidelity signal conditioning for applications such as CCDs, transmission lines and low impedance circuits. Even driving loads of 100 Ω , the CLC430 provides very low 2nd and 3rd harmonic distortion at 1MHz (-76/-82dBc).

Video distribution, multimedia and general purpose applications will benefit from the CLC430's wide bandwidth and disable feature. Power is reduced and the output becomes a high impedance when disabled. The wide gain range of the CLC430 makes this general purpose op amp an improved solution for circuits such as active filters. differential-to-single-ended drivers, DAC transimpedance amplifiers and MOSFET drivers.

Features

- 0.1dB gain flatness to 20MHz (A_V = +2)
- 100MHz bandwidth ($A_V = +1$)
- 2000V/µs slew rate

Connection Diagram

- ±5V, ±15V or single supplies
- 100ns disable to high impedance output
- Wide gain range
- Low cost

Applications

- Video distribution
- CCD clock driver
- Multimedia systems
- DAC output buffers

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

Note 2: Min/max ratings are based on product characterization and simulation. Individual parameters are tested as noted. Outgoing quality levels are determined from tested parameters.

Note 3: AJ-level: spec. is 100% tested at +25°C.

Note 4: Output is short circuit protected to ground, however maximum reliability is obtained if output current does not exceed 125mA.

Note 5: To <50dB attenuation @10MHz.

Application Division

General Design Considerations

The CLC430 is a general purpose current-feedback amplifier for use in a variety of small and large signal applications. Use the feedback resistor to fine tune the gain flatness and –3dB bandwidth for any gain setting. National provides information for the performance at a gain of +2 for small and large signal bandwidths. The plots show feedback resistor values for selected gains.

Gain

Use the following equations to set the CLC430's non-inverting or inverting gain:

Non-Inverting Gain =
$$1 + \frac{R_f}{R_g}$$

Inverting Gain = $-\frac{R_f}{R_g}$

Choose the resistor values for non-inverting or inverting gain by the following steps.

FIGURE 1. Component Identification

1) Select the recommended feedback resistor R_f (refer to plot in the plot section entitled R_f vs. Gain).

- 2) Choose the value of R_g to set gain.
- 3) Select $\rm R_{s}$ to set the circuit output impedance.
- 4) Select R_{in} for input impedance and input bias.

High Gains

Current feedback closed-loop bandwidth is independent of gain-bandwidth-product for small gain changes. For larger gain changes the optimum feedback resister R_f is derived by the following:

 $R_{f} = 724\Omega - 60\Omega \times (A_{V}).$

As gain is increased, the feedback resistor allows bandwidth to be held constant over a wide gain range. For a more complete explanation refer to application note OA-25 Stability Analysis of Current-Feedback Amplifiers.

Resistors have varying parasitics that affect circuit performance in high speed design. For best results, use leaded metal-film resistors or surface mount resistors. A SPICE model for the CLC430 is available to simulate overall circuit performance.

Enable/Disable Function

The CLC430 amplifier features an enable/disable function that changes the output and inverting input from low to high impedance. The pin 8 enable/disable logic levels are as follows:

V _{CC}	±15V	±5V
Enable	>12.7V	>2.7V
Disable	<10.0V	<0.08

The amplifier is enabled with pin 8 left open due to the $2k\Omega$ pull-up resistor, shown in *Figure 2*.

FIGURE 2. Pin 8 Equivalent Disable Circuit

Open-collector or CMOS interfaces are recommended to drive pin 8. The turn on and off time depends on the speed of the digital interface.

The equivalent output impedance when disabled is shown in *Figure 3*. With R_g connected to ground, the sum of R_f and R_g dominates and reduces the disabled output impedance. To raise the output impedance in the disabled state, connect the CLC430 as a unity-gain voltage follower by removing R_g. Current-feedback op-amps need the recommended R_f in a unity-gain follower circuit. For high density circuit layouts consider using the dual CLC431 (with disable) or the dual CLC432 (without disable).

FIGURE 3. Equivalent Disabled Output Impedance

2nd and 3rd Harmonic Distortion

To meet low distortion requirements, recognize the effect of the feedback resistor. Increasing the feedback resistor will decrease the loop gain and increase distortion. Decreasing the load impedance increases 3rd harmonic distortion more than 2nd.

Application Division (Continued)

Differential Gain and Differential Phase

The CLC430 has low DG and DP errors for video applications. Add an external pulldown resistor to the CLC430's output to improve DG and DP as seen in *Figure 4*. A 604 Ω R_P will improve DG and DP to 0.01% and 0.02°.

FIGURE 4. Improved DG and DP Video Amplifier

Printed Circuit Layout

To get the best amplifier performance careful placement of the amplifier, components and printed circuit traces must be observed. Place the 0.1μ F ceramic decoupling capacitors less than 0.1'' (3mm) from the power supply pins. Place the 6.8μ F tantalum capacitors less than 0.75'' (20mm) from the power supply pins. Shorten traces between the inverting pin and components to less than 0.25'' (6mm). Clear ground plane 0.1'' (3mm) away from pads and traces that connect to the inverting, non-inverting and output pins. Do not place ground or power plane beneath the op-amp package. National provides literature and evaluation boards 730013 DIP or 730027 SOIC illustrating the recommended op-amp layout.

Applications Circuits

Level Shifting

The circuit shown in *Figure 5* implements level shifting by AC coupling the input signal and summing a DC voltage. The resistor R_{in} and the capacitor C set the high-pass break frequency. The amplifier closed-loop bandwidth is fixed by the selection of R_f . The DC and AC gains for circuit of *Figure 5* are different. The AC gain is set by the ratio of R_f and R_g . And the DC gain is set by the parallel combination of R_g and R_g .

FIGURE 5. Level Shifting Circuit

Multiplexing

Multiple signal switching is easily handled with the disable function of the CLC430. Board trace capacitance at the output pin will affect the frequency response and switching transients. To lessen the effects of output capacitance place a resistor (R_o) within the feedback loop to isolate the outputs as shown in *Figure 6*. To match the mux output impedance to a transmission line, add a resistor (R_s) in series with the output.

FIGURE 6. Output Connection

Application Division (Continued)

Automatic Gain Control

Current-feedback amplifiers can implement very fast automatic-gain control circuits. The circuit shown in *Figure 7* shows an AGC circuit using the CLC430, a half-wave rectifier, an integrator and a FET. The CLC430 current-feedback amplifier maintains constant bandwidth and linear phase over AGC's gain range. This circuit effectively controls the output level for continuous signals.

The bandwidth of CLC430 AGC is limited by $R_{\rm f},$ the feedback resistor. The FET gate voltage is limited to a range of:

$$-2.5 < V_g < -1$$

R of 750 Ω and C1 of 1.0 μ F gives a useful R_{ds} range of approximately 150 to 2k Ω . Scaling the integrator gain or adding attenuation before the diode D accommodates large signal swings. Determine the overall gain by:

$$1 + \frac{R_f}{R_g + R_{ds}}$$

The integrator sets the loop time constant.

Notes

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

 Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
