Functional Description

The CY2907 is a general purpose clock generator designed for use in a wide variety of applications—from graphics to PC peripherals to disk drives. It generates selectable system clock frequencies from a single reference input (crystal or reference clock). The CY2907 is configured with an EPROM array, similar to the other devices in the Cypress EPROM Programmable Clock family, making it easy to customize for any application. Furthermore, the CY2907 is compatible with all industry standard 9107 and 9108 clock synthesizers.

Device Programming

Two versions of the CY2907 are available - Field Programmable and Factory Programmable. Field programmable devices must be programmed before being installed in an application. They are one-time-programmable (OTP). Customers can program small quantities in-house using the Cypress CY3670 programmer. Production quantities are available through Cypress's value-added distribution partners, or by using third party programmers from BP Microsystems, Hi-Lo Systems, and others.

For high volume orders, devices can be factory programmed by Cypress. All requests must be submitted to the local Cypress Field Application Engineer (FAE) or sales representative. After the request is processed, you receive a new part number, samples, and a data sheet with the programmed values. This part number is used for additional sample requests and production orders.

CyberClocks™ Software

CyberClocks is an easy-to-use software application that enables the user to configure any one of the EPROM Programmable Clocks offered by Cypress. You may specify the input frequency, PLL and output frequencies, and different functional options. Note the output frequency ranges in this data sheet when specifying them in CyberClocks to make sure that you stay within the limits. After a configuration is established, you can print the configuration and save programming files in ENT and JED formats.

CyberClocks runs on PCs running the Windows™ operating system, and is available for free download on the Cypress Semiconductor website at www.cypress.com.

Within the CyberClocks application, the CY2907 is found in the CyClocks™ section. Note that the standalone CyberClocks software should not be confused with the CyberClocks Online software, which is a web-based application that is used to configure other programmable clock devices.

Cypress CY3670 Programming Kit

Cypress's CY3670 is a portable programmer that connects to a PC serial port and enables users of CyClocks software to quickly and easily program any of the CY2291F, CY2292F, CY2071AF, and CY2907F devices. An adapter is also required and is ordered separately. The CY3097 is the adapter for the CY2907F8. For the CY2907F14, order adapter CY3098.
