

8Kx8 Power-Switched and Reprogrammable PROM

CMOS for optimum speed/power

- · Windowed for reprogrammability
- High speed

Features

- -20 ns (Commercial)
- Low power
 - -660 mW (Commercial)
- · Super low standby power
 - Less than 85 mW when deselected
- EPROM technology 100% programmable
- 5V ±10% V_{CC}, commercial and military
- TTL-compatible I/O
- Direct replacement for 27C64 EPROMs

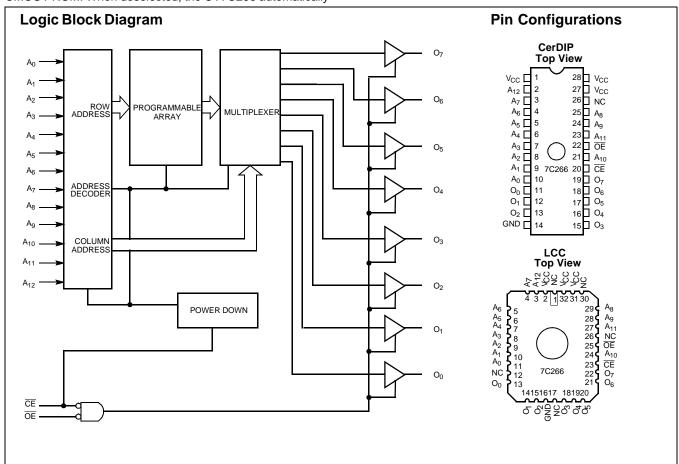

Functional Description

The CY7C266 is a high-performance 8192-word by 8-bit CMOS PROM. When deselected, the CY7C266 automatically

powers down into a low-power standby mode. It is packaged in a 600-mil-wide package. The reprogrammable packages are equipped with an erasure window; when exposed to UV light, these PROMs are erased and can then be reprogrammed. The memory cells utilize proven EPROM floating-gate technology and byte-wide intelligent programming algorithms.

The CY7C266 is a plug-in replacement for EPROM devices. The EPROM cell requires only 12.5V for the super voltage and low-current requirements allow for gang programming. The EPROM cells allow for each memory location to be tested 100%, as each location is written into, erased, and repeatedly exercised prior to encapsulation. Each PROM is also tested for AC performance to guarantee that after customer programming, the product will meet DC and AC specification limits.

Reading is accomplished by placing an active LOW signal on \overline{OE} and \overline{CE} . The contents of the memory location addressed by the address lines (A_0 through A_{12}) will become available on the output lines (O_0 through O_7).

Notes:

- The voltage on any input or I/O pin cannot exceed the power pin during power-up.

 See the "Introduction to CMOS PROMs" section of the Cypress Data Book for general information on testing.

 For test purposes, not more than one output at a time should be shorted. Short circuit test duration should not exceed 30 seconds.

Erasure Characteristics

Wavelengths of light less than 4000 angstroms begin to erase the devices in the windowed package. For this reason, an opaque label should be placed over the window if the EPROM is exposed to sunlight or fluorescent lighting for extended periods of time.

The recommended dose of ultraviolet light for erasure is a wavelength of 2537 angstroms for a minimum dose (UV intensity multiplied by exposure time) of 25 Wsec/cm². For an ultraviolet lamp with a 12 mW/cm² power rating, the exposure time would be approximately 35 minutes. The CY7C266 needs to be within 1 inch of the lamp during erasure. Permanent damage may

result if the EPROM is exposed to high-intensity UV light for an extended period of time.

7258 Wsec/cm2 is the recommended maximum dosage.

Programming Modes

Programming support is available from Cypress as well as from a number of third party software vendors. For detailed programming information, including a listing of software packages, please see the PROM Programming Information located at the end of this section. Programming algorithms can be obtained from any Cypress representative.
