

DCP0105 Series

Miniature 5V Input, 1W Isolated UNREGULATED DC/DC CONVERTERS

FEATURES

- STANDARD JEDEC PLASTIC PACKAGE
- MEETS EN55022 CLASS B
- LOW PROFILE: 0.15" (3.8mm)
- SYNCHRONIZABLE
- OUTPUT SHORT CIRCUIT PROTECTION
- THERMAL SHUTDOWN
- STARTS INTO ANY CAPACITIVE LOAD
- FLOATING OUTPUTS
- EFFICIENCY: Up to 75% (at Full Load)
- 1000Vrms ISOLATION
- 400kHz SWITCHING
- 108 MILLION HOURS MTF
- 5V, $\pm 5V$, 12V, $\pm 12V$, 15V, $\pm 15V$ OUTPUTS
- AVAILABLE IN TAPE AND REEL

APPLICATIONS

- POINT OF USE POWER CONVERSION
- DIGITAL INTERFACE POWER
- GROUND LOOP ELIMINATION
- DATA ACQUISITION
- INDUSTRIAL CONTROL AND INSTRUMENTATION
- TEST EQUIPMENT

DESCRIPTION

The DCP0105 family is a series of high efficiency, 5V input isolated DC/DC converters. In addition to 1W nominal galvanically isolated output power capability, the range of DC/DCs are also fully synchronizable. The devices feature thermal shutdown, and overload protection is implemented via watchdog circuitry. Advanced power-on reset techniques give superior reset performance and the devices will start into any capacitive load up to full power output.

The DCP0105 family is implemented in standard-molded IC packaging, giving outlines suitable for high volume assembly.

EMC SPECIFICATIONS

Specifications and Related Documents

The DCP010505 was tested to and complied with the limits of the following EMC specifications:

- prEN55022 (1992) Conducted RF emission, telecomm lines.
- EN55022 (1995) Limits and methods of measurement of radio interference characteristics of information technology equipment.
- ENV50140 (1993) Electromagnetic compatibility. Basic immunity standard. Radiated RF immunity.
- ENV50141 (1993) Electromagnetic compatibility. Basic immunity standard. Conducted RF immunity.
- EN61000-4-2 (1995) Electromagnetic compatibility, Part 4. Testing and measurement techniques, Section 2. Electrostatic discharge.
- EN61000-4-4 (1995) Electromagnetic compatibility, Part 4. Testing and measurement techniques, Section 4. Electrical fast transient bursts.
- EN61000-4-8 (1994) Electromagnetic compatibility, Part 4. Testing and measurement techniques, Section 8. Power frequency magnetic field immunity.

List of Tests

The following is a list of tests which were required for compliance with the above specifications:

- Conducted Emission Test 150kHz to 30MHz, power and output lines, Class B limits applying. DC/DC loads of 0%, 8%, and 120% applying.
- Radiated Emission Test 30MHz to 1000MHz, Class B limits applying. DC/DC loads of 0%, 8%, and 120% applying.
- Radiated Immunity Test, Electric Field 80MHz to 1000MHz, 10V/m, 1kHz 80% AM.
- Radiated Immunity Test, Electric Field 900MHz, 10V/m, 200Hz 100% PM.
- Electrostatic Discharge Test 4kV, HCP/VCP indirect discharge only.
- Electrical Fast Transient Tests 2kV power lines, 2kV signal lines.
- Conducted RF Immunity Tests 150kHz to 80MHz, power and output lines, 10Vrms, 1kHz 80% AM.
- Radiated Immunity Test, Magnetic Field 50Hz, 30A/m

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

At $T_A = +25^\circ\text{C}$, V_{OUT} nominal (V_{NOM}) = $\pm 5\text{V}$ and $V_S = +5\text{V}$, unless otherwise noted.

TYPICAL PERFORMANCE CURVES (DCP010512 Specific)

At $T_A = +25^\circ\text{C}$, V_{OUT} nominal ($V_{\text{NOM}} = +12\text{V}$) and $V_S = +5\text{V}$, unless otherwise noted.

TYPICAL PERFORMANCE CURVES (DCP010512D Specific)

At $T_A = +25^\circ\text{C}$, V_{OUT} nominal ($V_{\text{NOM}} = \pm 12\text{V}$) and $V_S = +5\text{V}$, unless otherwise noted.

TYPICAL PERFORMANCE CURVES (DCP010515 Specific)

At $T_A = +25^\circ\text{C}$, V_{OUT} nominal (V_{NOM}) = +15V and $V_S = +5\text{V}$, unless otherwise noted.

TYPICAL PERFORMANCE CURVES (DCP010515D Specific)

At $T_A = +25^\circ\text{C}$, V_{OUT} nominal (V_{NOM}) = $\pm 15\text{V}$ and $V_S = +5\text{V}$, unless otherwise noted.

FUNCTIONAL DESCRIPTION

OVERVIEW

The DCP0105 offers 1W of unregulated output power from a 5V input source with a typical efficiency of up to 75%. This is achieved through highly integrated packaging technology and the implementation of a custom power stage and control IC.

POWER STAGE

This uses a push-pull, center-tapped topology switching at 400kHz (divide by 2 from 800kHz oscillator).

OSCILLATOR AND WATCHDOG

The on-board 800kHz oscillator provides the switching frequency via a divide by 2 circuit and allows synchronization via the SYNC_{IN} pins. To synchronize any number of DCP0105 family of devices, simply tie the SYNC_{IN} pins together (see the Synchronization section). The watchdog circuitry protects the DC/DC against a stopped oscillator and checks the oscillator frequency which will shut down the output stage if it drops below a certain threshold—i.e., it will be tri-stated after approximately 10μs.

THERMAL SHUTDOWN

The DCP0105 is also protected by thermal shutdown. If the on-chip temperature reaches a predetermined value, the DC/DC will shutdown. This effectively gives indefinite short circuit protection for the DC/DC.

SYNCHRONIZATION

Any number of DCP0105 devices can be synchronized by connecting the SYNC_{IN} pins on the devices together (see Figure 1). All the DCP0105 devices will then self-synchronize.

This same synchronization method will apply to other V_{IN} versions of the DCP01 family, allowing synchronization of various V_{OUT} and V_{IN} DC/DCs.

Care must taken as synchronized DCP0105s will turn on simultaneously very quickly and draw 300mA each until each output capacitor is fully charged. This may exact a heavy demand on the input power supply.

The SYNC_{OUT} pin gives an unrectified 400kHz signal from the transformer. This can be used to set the timing of external circuitry on the output side. In noise sensitive applications any pick-up from the SYNC_{OUT} pin can be minimized by putting a guard ring round the pin (see Figure 7).

FIGURE 1. Standard Interface.

DIVIDE BY 2 RESET

Isolated DC/DC converter performance normally suffers after power reset. This is because a change in the steady state transformer flux creates an offset after power-up. The DCP01 family does not suffer from this problem. This is achieved through a patented⁽¹⁾ technique employed on the divide by 2 reset circuitry resulting in no change in output phase after power interruption.

CONSTRUCTION

The DCP0105's basic construction is the same as standard ICs. There is no substrate within the molded package. The DCP0105 is constructed using an IC, rectifier diodes, and a wound magnetic toroid on a leadframe. As there is no solder within the package, the DCP0105 does not require any special PCB assembly processing. This results in an isolated DC/DC with inherently high reliability.

ADDITIONAL FUNCTIONS

DISABLE/ENABLE

The DCP0105 can be disabled or enabled by driving the SYNC_{IN} pin with an open drain CMOS gate. If the SYNC_{IN} pin is pulled LOW, the DCP0105 will disable. The disable time depends on the output loading but the internal shutdown takes up to 10μs. Making the gate open drain will re-enable the DCP0105. However, there is a trade-off in using this function; the DCP0105 quiescent current may increase and the on-chip oscillator may run slower. This degradation in performance is dependent on the external CMOS gate capacitance. Therefore, the smaller the capacitance, the lower the

Connecting the DCP0105 in Series

Multiple DCP0105 isolated 1W DC/DC converters can be connected in series to provide non-standard voltage rails. This is possible by utilizing the floating outputs provided by the DCP0105's galvanic isolation.

Connect the positive V_{OUT} from one DCP0105 to the negative V_{OUT} (0V) of another (see Figure 4). If the $SYNC_{IN}$ pins are tied together, the self-synchronization feature of the DCP0105 will prevent beat frequencies on the voltage rails. The SYNC feature of the DCP0105 allows easy series connection without external filtering which is necessary in competing solutions.

The outputs on dual output DCP0105 versions can also be connected in series to provide 2 times the magnitude of V_{OUT} (see Figure 5). For example, a dual 12V DCP010512D could be connected to provide a 24V rail.

Connecting the DCP0105 in Parallel

If the output power from one DCP0105 is not sufficient, it is possible to parallel the outputs of multiple DCP0105s (see Figure 6). Again, the SYNC feature allows easy synchronization to prevent power-rail beat frequencies at no additional filtering cost.

THERMAL MANAGEMENT LAYOUT

To maximize the thermal performance of the DCP0105, taking more care in the PCB layout can provide the most efficient thermal dissipation paths from the DC/DC. The input controller IC and the rectifier diodes inside the DCP0105 are bonded directly onto the internal leadframe. The leadframe, being almost 100% copper, provides an excellent path for dissipated heat and does so significantly more efficiently than FR4 PCBs or ceramic substrates found in alternate packaging technology DC/DCs.

FIGURE 4. Connecting the DCP0105 in Series.

FIGURE 5. Connecting Dual Outputs in Series.

FIGURE 6. Connecting Multiple DCP0105s in Parallel.

Most of the dissipated heat comes from input side common (pin 2). To a lesser extent, the $+V_{OUT}$ pin (pin 6) also dissipates heat from the package. In the layout shown in Figure 7, the large copper areas next to pins 2 and 6 will provide excellent heat dissipation paths.

The tracking in Figure 7, shown in dotted lines, will provide shielding for the $SYNC_{IN}$ (pin 14) and $SYNC_{OUT}$ (pin 7) pins if necessary.

As described earlier in the Disable/Enable section of this data sheet, any additional capacitance to the 25pF internal capacitor at the $SYNC_{IN}$ pin will affect performance. If there is the possibility of significant leakage capacitance at the $SYNC_{IN}$ pin, it can be shielded as shown.

As described earlier in the Synchronization section of this data sheet, the $SYNC_{OUT}$ pin can be shielded as shown to minimize noise pick-up in sensitive applications.

FIGURE 7. Thermal Management Layout.

LAYOUT FOR DCP0105 AND SIP PRODUCTS

Figure 8 shows a layout to allow the use of a DCP0105 and a competitive SIP isolated DC/DC converter.

POST REGULATION OF THE DCP010505P USING THE LP2986 LDO REGULATOR

In digital applications where the load range is wide or evolving, or the input supply voltage is not well regulated and $5V \pm 5\%$ or $5V \pm 10\%$ cannot be guaranteed, it is often necessary to have a regulated 5V output from the DCP0105.

It is possible to post regulate the $5V_{OUT}$ DCP0105 and still guarantee a minimum V_{OUT} of 4.75V. This still gives the benefits of isolation in reducing the power supply noise to 5V digital circuitry.

By using an ultra-low dropout regulator (e.g., National Semiconductor's LP2986IM-5.0) in series with the output of a $5V_{OUT}$ DCP0105, it is possible to supply up to 100% load current (depending on V_{IN}). Figure 9 shows the typical load current for the post-regulated $5V_{IN}/5V_{OUT}$ DCP010505. It is possible with a V_{IN} of 5V to supply 130mA. Because of the 1:1 line regulation of the DCP0105, a 5% change in the input will result in a 5% change in the output. Therefore, the amount of current that the LDO can deliver is strongly

dependent on the V_{IN} of the DCP010505. With a V_{IN} of 5.25V, the LP2986 LDO can deliver up to 165mA.

The LP2986 LDO has a very low dropout voltage of typically less than 180mV, which allows us to deliver 4.75V guaranteed from a $5V_{OUT}$ unregulated DC/DC. It also offers low output flagging and shutdown capability and is supplied in either MSOP-8 or SO-8 packages ensuring additional board area is minimal and low profile is maintained.

FIGURE 8. PCB Layout for DCP0105 and Competitive SIP DC/DC.

FIGURE 9. DCP010505P AND LP2986 Regulator.

DCP01 AND LP2986 APPLICATION CIRCUIT

Figure 10 shows the LP2986 in series with the DCP010505 output. The $2.2\mu F$ capacitor on the input of the LP2986 and the $4.7\mu F$ capacitor on the output are the minimum recommended for good ripple reduction. Pin 7 on the LP2986 flags an error by going LOW if the output drops 5% below nominal.

OTHER LDO REGULATORS

The SGS-Thomson L4940V5 LDO can also be used to post regulate the 5V_{OUT} DCP010505 and can deliver a regulated minimum 4.75V up to 135mA.

The 5V_{OUT} DCP010505 can also be post regulated with the Micrel MIC5207 which offers up to 180mA output drive with a typical dropout voltage of 165mV at 150mA. The MIC5207 is available in a micro-sized SOT23-5 package which gives the minimum additional board area for post regulation.

PREDICTING OUTPUT VOLTAGE VERSUS LOAD

The Load Regulation specifications are calculated as follows:

CONDITION	CALCULATION
10% to 100% Load	$(V_{OUT} \text{ at } 10\% \text{ load} - V_{OUT} \text{ at } 100\% \text{ load}) / V_{OUT} \text{ at } 75\% \text{ load}$
10% to 25% Load	$(V_{OUT} \text{ at } 10\% \text{ load} - V_{OUT} \text{ at } 25\% \text{ load}) / V_{OUT} \text{ at } 25\% \text{ load}$
10% to 75% Load	$(V_{OUT} \text{ at } 10\% \text{ load} - V_{OUT} \text{ at } 75\% \text{ load}) / V_{OUT} \text{ at } 75\% \text{ load}$
75% to 100% Load	$(V_{OUT} \text{ at } 75\% \text{ load} - V_{OUT} \text{ at } 100\% \text{ load}) / V_{OUT} \text{ at } 75\% \text{ load}$

1. To predict the output voltage at 100% load take the measured or specified voltage at 75% load and multiply by (1 + Load Reg 75% to 100%). For example a DCP010505P typical V_{OUT} at 100% load will be 5V x (1 - 8%) = 4.6V.

2. To predict the output voltage at 10% load take the measured or specified voltage at 75% load and multiply by (1 + Load Reg 10% to 75%). For example a DCP010505P typical V_{OUT} at 10% load will be 5V x (1 + 17%) = 5.85V.

3. To predict the output voltage at 25% load on higher V_{OUT} versions take the measured or specified voltage at 75% load and multiply by (1 + Load Reg 25% to 75%). For example a DCP010512P typical V_{OUT} at 25% load will be 12V x (1 + 12%) = 13.4V. To then estimate the voltage at 10% load take the previously calculated V_{OUT} at 25% load and multiply by (1 + Load Reg 10% to 25%). In this case the typical V_{OUT} at 10% load will be 13.4V x (1 + 7%) = 14.3V.

To obtain predictions for loads other than those specified assume the V_{OUT} versus load characteristic is linear between the load points and calculate accordingly. The 10% to 100% load specification guarantees the maximum voltage excursion for any load between 10% to 100% with respect to V_{OUT} at 75% load.

The above does not take into consideration line regulation and assumes a nominal input voltage. The 1:1 line regulation of the DCP01 family means that a percentage change in the input will give a corresponding percentage change in the output.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
