# National Semiconductor

# DM54LS373/DM74LS373, 54LS374/DM54LS374/DM74LS374 TRI-STATE® Octal D-Type Transparent Latches and Edge-Triggered Flip-Flops

## **General Description**

These 8-bit registers feature totem-pole TRI-STATE outputs designed specifically for driving highly-capacitive or relatively low-impedance loads. The high-impedance state and increased high-logic level drive provide these registers with the capability of being connected directly to and driving the bus lines in a bus-organized system without need for interface or pull-up components. They are particularly attractive for implementing buffer registers, I/O ports, bidirectional bus drivers, and working registers. (Continued)

## Features

- Choice of 8 latches or 8 D-type flip-flops in a single package
- TRI-STATE bus-driving outputs
- Full parallel-access for loading
- Buffered control inputs
- P-N-P inputs reduce D-C loading on data lines
- Alternate military/aerospace device (54LS374) is available. Contact a National Semiconductor sales office/ distributor for specifications.

## **Connection Diagrams**

## **General Description** (Continued)

The eight latches of the DM54/74LS373 are transparent Dtype latches meaning that while the enable (G) is high the Q outputs will follow the data (D) inputs. When the enable is taken low the output will be latched at the level of the data that was set up.

The eight flip-flops of the DM54/74LS374 are edge-triggered D-type flip flops. On the positive transition of the clock, the Q outputs will be set to the logic states that were set up at the D inputs.

| A buffered output control input can be used to place the        |
|---|
| eight outputs in either a normal logic state (high or low logic |
| levels) or a high-impedance state. In the high-impedance        |
| state the outputs neither load nor drive the bus lines signifi- |
| cantly.   |

The output control does not affect the internal operation of the latches or flip-flops. That is, the old data can be retained or new data can be entered even while the outputs are off.

DM54/74LS374

| Output | Out<br>Con | put Cloc<br>trol | k D | Output         |
|--------|------------|------------------|-----|----------------|
| н      | L          | · 1              | н   | н              |

## Absolute Maximum Ratings (See Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

| Supply Voltage                       | 7V              |
|--------------------------------------|-----------------|
| Input Voltage                        | 7V              |
| Storage Temperature Range            | -65°C to +150°C |
| Operating Free Air Temperature Range |                 |
| DM54LS and 54LS                      | -55°C to +125°C |
| DM74LS                               | 0°C to +70°C    |
|                                      |                 |

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 1: All typicals are at  $V_{CC} = 5V$ ,  $T_A = 25^{\circ}C$ .

Note 2: Not more than one output should be shorted at a time, and the duration should not exceed one second.

Note 3:  $C_L = 5 \text{ pF}.$
