DM54LS73A/DM74LS73A Dual Negative-Edge-Triggered Master-Slave J-K Flip-Flops with Clear and Complementary Outputs

General Description

This device contains two independent negative-edge-triggered J-K flip-flops with complementary outputs. The J and K data is processed by the flip-flops on the falling edge of the clock pulse. The clock triggering occurs at a voltage level and is not directly related to the transition time of the negative going edge of the clock pulse. The data on the J and K inputs is allowed to change while the clock is high or low without affecting the outputs as long as setup and hold times are not violated. A low logic level on the clear input will reset the outputs regardless of the levels of the other inputs.

Function Table

	Inpute	Outputs				
CLR	CLK	J	к	Q	Q	
L	х	х	х	L	н	
н	↓	L	L	Q0	\overline{Q}_0	
н	↓	н	L	н	L	
н	↓ ↓	L	н	L	н	
н	↓	н	н	Toggle		
н	н	х	X	Q ₀	\overline{Q}_0	

H = High Logic Level

L = Low Logic Level

X = Either Low or High Logic Level

↓ = Negative going edge of pulse.

 $\mathbf{Q}_{0}=\mathbf{The}$ output logic level before the indicated input conditions were established.

Toggle = Each output changes to the complement of its previous level on each falling edge of the clock pulse.

Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range	
DM54LS	-55°C to +125°C
DM74LS	0°C to +70°C
Storage Temperature Range	-65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

t _{PHL}	Propagation Delay Time High to Low Level Output	Clock to Q or Q		20		28	ns	

Note 1: All typicals are at $V_{CC} = 5V$, $T_A = 25^{\circ}C$.

Note 2: Not more than one output should be shorted at a time, and the duration should not exceed one second. For devices, with feedback from the outputs, where shorting the outputs to ground may cause the outputs to change logic state, an equivalent test may be performed where $V_0 = 2.25V$ and 2.125V for DM54 and DM74 series, respectively, with the minimum and maximum limits reduced by one half from their stated values. This is very useful when using automatic test equipment.

Note 3: With all outputs open, I_{CC} is measured with the Q and Q outputs high in turn. At the time of measurement, the clock is grounded.
