

DM54S112/DM74S112 Dual Negative-Edge-Triggered Master-Slave J-K Flip-Flops with Preset, Clear, and Complementary Outputs

General Description

This device contains two independent negative-edge-triggered J-K flip-flops with complementary outputs. The J and K data is processed by the flip-flops on the falling edge of the clock pulse. The clock triggering occurs at a voltage level and is not directly related to the transition time of the negative going edge of the clock pulse. Data on the J and K

inputs can be changed while the clock is high or low without affecting the outputs as long as setup and hold times are not violated. A low logic level on the preset or clear inputs will set or reset the outputs regardless of the logic levels of the other inputs.

H	H	H	X	X	Q_0	$\bar{Q}_0$

H = High Logic Level

X = Either Low or High Logic Level

L = Low Logic Level

↓ = Negative going edge of pulse.

Q_0 = The output logic level of Q before the indicated input conditions were established.

* = This configuration is nonstable; that is, it will not persist when either the preset and/or clear inputs return to its inactive (high) level.

Toggle = Each output changes to the complement of its previous level on each falling edge of the clock pulse.

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
