DM54S113/DM74S113 Dual Negative-Edge-Triggered Master-Slave J-K Flip-Flops with Preset and Complementary Outputs

General Description

This device contains two independent negative-edge-triggered J-K flip-flops with complementary outputs. The J and K data is processed by the flip-flops on the falling edge of the clock pulse. The clock triggering occurs at a voltage level and is not directly related to the transition time of the negative going edge of the clock pulse. Data on the J and K inputs may be changed while the clock is high or low without affecting the outputs as long as setup and hold times are not violated. A low logic level on the preset input will set the outputs regardless of the logic levels of the other inputs.
