

## DRV870x-Q1 Automotive H-Bridge Gate Driver

### 1 Features

- AEC-Q100 Qualified for Automotive Applications
  - Device Temperature Grade 1: –40°C to +125°C Ambient Operating Temperature
- Single H-Bridge Gate Driver
  - Drives Four External N-Channel MOSFETs
  - Supports 100% PWM Duty Cycle
- 5.5- to 45-V Operating Supply-Voltage Range
- Three Control-Interface Options
  - PH/EN, Independent H-Bridge, and PWM
- Serial Interface for Configuration (DRV8703-Q1)
- Smart Gate Drive Architecture
  - Adjustable Slew-Rate Control
  - 10-mA to 260-mA Peak High-Side Source Current
  - 20-mA to 440-mA Peak High-Side Sink Current
  - 10-mA to 225-mA Peak Low-Side Source Current
  - 20-mA to 430-mA Peak Low-Side Sink Current
- Independent Control of Each H-Bridge
- Supports 1.8-V, 3.3-V, and 5-V logic inputs
- Current-Shunt Amplifier
- Integrated PWM Current Regulation
- Low-Power Sleep Mode
- Small Package and Footprint
  - 32-Pin VQFN
  - 5 mm × 5 mm
  - Wettable Flanks Package
- Protection Features
  - Supply Undervoltage Lockout (UVLO)
  - Charge-Pump Undervoltage (CPUV) Lockout

- Overcurrent Protection (OCP)
- Gate-Driver Fault (GDF)
- Thermal Shutdown (TSD)
- Watchdog Timer (DRV8703-Q1)
- Fault-Condition Output (nFAULT)

### 2 Applications

- Power Window Lift
- Power Sunroof
- Power Seats
- Power Sliding Door
- Relay Replacement
  - Application Report: [SLVA837](#)
  - TI Design: [TIDUCQ9](#)
- Power Trunk and Tailgate
- Brushed-DC Pumps

### 3 Description

The DRV870x-Q1 devices are single H-bridge gate drivers that use four external N-channel MOSFETs targeted to drive a bidirectional brushed-DC motor.

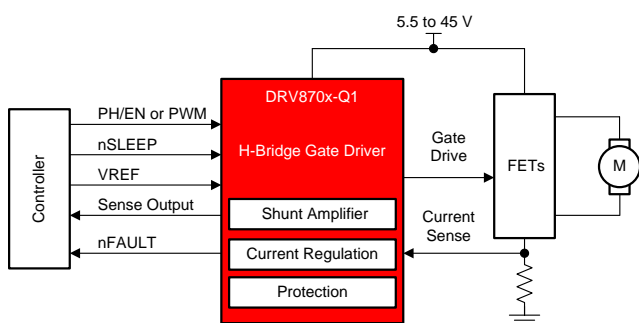

A PH/EN, independent H-Bridge, or PWM interface allows simple interfacing to controller circuits. An internal sense amplifier provides adjustable current control. Integrated Charge-Pump allows for 100% duty cycle support and can be used to drive external reverse battery switch.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8702-Q1	VQFN (32)	5.00 mm × 5.00 mm
DRV8703-Q1		

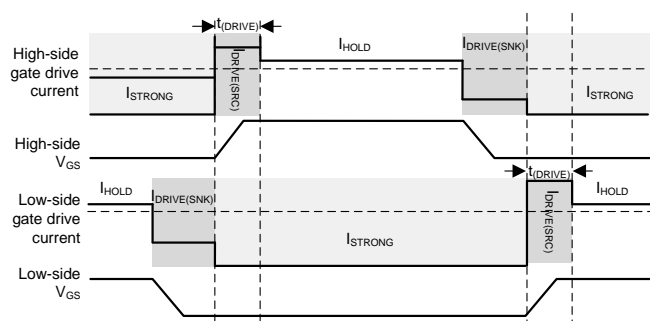

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision B (March 2017) to Revision C</b>	<b>Page</b>
• Changed the <i>Features</i> and <i>Descriptions</i> sections.....	<b>3</b>
• Changed the type of the SL2 pin from O to I in the <i>Pin Functions</i> table.....	<b>5</b>
• Changed Continuous/pulsed shunt amp. input pin voltage increased to 1.2 V from 1.0 V. In Control Pin Voltage, Changed VVDS to VDS.....	<b>6</b>
• Changed V <sub>off</sub> to V <sub>io</sub> .....	<b>11</b>
• Changed SPI parameter name conventions.....	<b>12</b>
• Changed the V <sub>DS(OCF)</sub> from 0.86 V to 0.96 V in the <i>OCP Threshold Voltage</i> graph.....	<b>16</b>
• Changed the I <sub>(CHOP)</sub> equation in the <i>Current Regulation</i> and <i>Current Chopping Configuration</i> sections .....	<b>25</b>
• Changed the current equation in the <i>Amplifier Output (SO)</i> section.....	<b>25</b>
• Changed the description of the WD_EN bit in the <i>IDRIVE</i> and <i>WD Field Descriptions</i> table.....	<b>44</b>

<b>Changes from Revision A (November 2016) to Revision B</b>	<b>Page</b>
• Changed references of PVDD to VM throughout the document .....	<b>3</b>
• Added the R <sub>(VDRAIN)</sub> note to the <i>External Components</i> table .....	<b>22</b>
• Changed one resistor value from 32 kΩ to 65 kΩ in the <i>MODE Pin Block Diagram</i> .....	<b>24</b>
• Changed what happens when a fault condition is no longer present in the <i>Overcurrent Protection (OCP)</i> section.....	<b>35</b>
• Deleted A <sub>V</sub> × from the I(CHOP) equation in the <i>Current Chopping Configuration</i> section.....	<b>49</b>

<b>Changes from Original (October 2016) to Revision A</b>	<b>Page</b>
• Released the full version of the data sheet .....	<b>3</b>

## 5 Description (continued)

Independent Half Bridge mode allows sharing of half bridges to control multiple DC motors sequentially in a cost-efficient way. The gate driver includes circuitry to regulate the winding current using fixed off-time PWM current chopping.

The DRV870x-Q1 devices include Smart Gate Drive technology to remove the need for any external gate components (resistors and Zener diodes) while fully protecting the external FETs. The Smart Gate Drive architecture optimizes dead time to avoid any shoot-through conditions, provides flexibility in reducing electromagnetic interference (EMI) with programmable slew-rate control and protects against any gate-short conditions. Additionally, active and passive pulldowns are included to prevent any dv/dt gate turnon.

A low-power sleep mode is provided which shuts down internal circuitry to achieve a very-low quiescent-current draw. The device can be used in a very compact design because of its small 5 mm × 5 mm package with few external components.

### Pin Functions

NAME	PIN NO.		TYPE <sup>(1)</sup>	DESCRIPTION
	DRV8702-Q1	DRV8703-Q1		
AVDD	14	14	PWR	Analog regulator. This pin is the 5-V analog supply regulator. Bypass this pin to ground with a 6.3-V, 1-μF ceramic capacitor.
CPH	30	30	PWR	Charge-pump switching node. Connect a 0.1-μF X7R capacitor rated for the supply voltage (VM) between the CPH and CPL pins.
CPL	31	31	PWR	Charge-pump switching node. Connect a 0.1-μF X7R capacitor rated for the supply voltage (VM) between the CPH and CPL pins.
DVDD	12	12	PWR	Logic regulator. This pin is the regulator for the 3.3-V logic supply. Bypass this pin to ground with a 6.3-V, 1-μF ceramic capacitor.
GH1	18	18	O	High-side gate. Connect this pin to the high-side FET gate.
GH2	26	26	O	High-side gate. Connect this pin to the high-side FET gate.
GL1	20	20	O	Low-side gate. Connect this pin to the low-side FET gate.
GL2	24	24	O	Low-side gate. Connect this pin to the low-side FET gate.
GND	1	1	PWR	Device ground. Connect this pin to the system ground.
GND	13	13	PWR	Device ground. Connect this pin to the system ground.
GND	17	17	PWR	Device ground. Connect this pin to the system ground.
GND	4	—	PWR	Device ground. Connect this pin to the system ground.
GND	7	—	PWR	Device ground. Connect this pin to the system ground.
GND	9	—	PWR	Device ground. Connect this pin to the system ground.
IDRIVE	5	—	I	Current setting pin for the gate drive. The resistor value or voltage forced on this pin sets the gate-drive current. For more information see the <a href="#">IDRIVE Configuration</a> section.
IN1/PH	2	2	I	Input control pins. The logic of this pin is dependent on the MODE pin.

(1) I = input, O = output, PWR = power, NC = no connect, OD = open-drain output

### Pin Functions (continued)

PIN			TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.			
	DRV8702-Q1	DRV8703-Q1		
IN2/EN	3	3	I	Input control pins. The logic of this pin is dependent on the MODE pin.
MODE	11	11	I	Mode control pin. Pull this pin to logic low to use H-bridge operation. Pull this pin to logic high for independent half-bridge operation. This pin is connected to an internal resistor divider. Operation of this pin is latched on power up or when exiting sleep mode.
NC	32	32	NC	No connect. No internal connection.
SCLK	—	7	I	SPI clock. This pin is for the SPI clock signal.
SDI	—	6	I	SPI input. This pin is for the SPI input signal.
SDO	—	4	OD	SPI output. This pin is for the SPI output signal. This pin is an open-drain output that requires an external pullup resistor.
SH1	19	19	I	High-side source. Connect this pin to the high-side FET source.
SH2	25	25	I	High-side source. Connect this pin to the high-side FET source
SL2	23	23	I	Low-side source. Connect this pin to the low-side FET source.
SN	22	22	I	Shunt-amplifier negative input. Connect this pin to the current-sense resistor.
SO	16	16	O	Shunt-amplifier output. The voltage on this pin is equal to the SP voltage times A <sub>V</sub> plus an offset. Place no more than 1 nF of capacitance on this pin.
SP	21	21	I	Shunt-amplifier positive input. Connect this pin to the current-sense resistor.
VCP	29	29	PWR	Charge-pump output. Connect a 16-V, 1-μF ceramic capacitor between this pin and the VM pin.
VDRAIN	27	27	I	High-side FET drain connection. This pin is common for the two H-bridges.
VDS	6	—	I	VDS monitor setting pin. The resistor value or voltage forced on this pin sets the VDS monitor threshold. For more information see the <a href="#">VDS Configuration</a> section.
VM	28	28	PWR	Power supply. Connect this pin to the motor supply voltage. Bypass this pin to ground with a 0.1-μF ceramic plus a 10-μF (minimum) capacitor.
VREF	15	15	I	Current set reference input. The voltage on this pin sets the driver chopping current.
nWDFLT	—	9	OD	Watchdog fault indication pin. This pin is pulled logic low when a watchdog fault condition occurs. This pin is an open-drain output that requires an external pullup resistor.
nFAULT	10	10	OD	Fault indication pin. This pin is pulled logic low when a fault condition occurs. This pin is an open-drain output that requires an external pullup resistor.
nSCS	—	5	I	SPI chip select. This pin is the select and enable for SPI. This pin is active low.
nSLEEP	8	8	I	Device sleep mode. Pull this pin to logic low to put device into a low-power sleep mode with the FETs in high impedance (Hi-Z). This pin is connected to an internal pulldown resistor.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Power supply voltage	VM	−0.3	47	V
Charge pump voltage	VCP, CPH	−0.3	$V_{VM} + 12$	V
Charge pump negative switching pin	CPL	−0.3	$V_{VM}$	V
Internal logic regulator voltage	DVDD	−0.3	3.8	V
Internal analog regulator voltage	AVDD	−0.3	5.75	V
Drain pin voltage	VDRAIN	−0.3	47	V
Voltage difference between supply and VDRAIN	$VM - VDRAIN$	−10	10	V
Control pin voltage	IN1, IN2, nSLEEP, nFAULT, VREF, IDRIVE, VDS, MODE, nSCS, SCLK, SDI, SDO, nWDFLT	−0.3	5.75	V
High-side gate pin voltage	GH1, GH2	−0.3	$V_{VM} + 12$	V
Low-side gate pin voltage	GL1, GL2	−0.3	12	V
Continuous phase-node pin voltage	SH1, SH2	−1.2	$V_{VM} + 1.2$	V
Pulsed 10-μs phase-node pin voltage	SH1, SH2	−2	$V_{VM} + 2$	V
Continuous shunt amplifier input pin voltage	SP	−0.5	1.2	V
	SN	−0.3	0.3	V
Pulsed 10-μs shunt amplifier input pin voltage	SP	−1	1.2	V
Shunt amplifier output pin voltage	SO	−0.3	5.75	V
Shunt amplifier output pin current	SO	0	5	mA
Maximum current, limit current with external series resistor	VDRAIN	−2	2	mA
Open-drain output current	nFAULT, SDO, nWDFLT	0	10	mA
Gate pin source current	GH1, GL1, GH2, GL2	0	250	mA
Gate pin sink current	GH1, GL1, GH2, GL2	0	500	mA
Operating junction temperature, $T_J$		−40	150	°C
Storage temperature, $T_{stg}$		−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup> HBM ESD Classification Level 2		±2000
	Charged-device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4B	All pins	±500
		Corner pins (1, 8, 9, 16, 17, 24, 25, and 32)	±750

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.3 Recommended Operating Conditions

			MIN	MAX	UNIT
$V_{VM}$	Power supply voltage	VM	5.5	45	V
$V_{CC}$	Logic-level input voltage		0	5.25	V
$V_{VREF}$	the description of Vvref Current Shunt Amplifier Reference Voltage	VREF	0.3 <sup>(1)</sup>	3.6	V
$f_{(PWM)}$	Applied PWM signal (IN1/IN2)	IN1, IN2		100	kHz
$I_{AVDD}$	AVDD external load current			30 <sup>(2)</sup>	mA
$I_{DVDD}$	DVDD external load current			30 <sup>(2)</sup>	mA
$I_{SO}$	Shunt-amplifier output-current loading	SO		5	mA
$T_A$	Operating ambient temperature		-40	125	°C

(1) Operational at  $V_{VREF} = 0$  to approximately 0.3 V, but accuracy is degraded.

(2) Power dissipation and thermal limits must be observed.

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV870x-Q1	UNIT
		RHB (VQFN)	
		32 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	32.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	19.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	6.8	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	0.3	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	6.8	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.8	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

### 7.5 Electrical Characteristics

Over recommended operating conditions unless otherwise noted. Typical limits apply for  $T_A = 25^\circ\text{C}$  and  $V_{VM} = 13.5\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES (VM, AVDD, DVDD)						
V <sub>VM</sub>	VM operating voltage	Gate drivers functional	5.5		45	V
		Logic functional	4.5		45	
I <sub>VM</sub>	VM operating supply current	V <sub>VM</sub> = 13.5 V; nSLEEP=1	5.5	7.5	12	mA
I <sub>(SLEEP)</sub>	VM sleep mode supply current	nSLEEP = 0, V <sub>VM</sub> = 13.5 V, T <sub>A</sub> = 25°C			14	μA
		nSLEEP = 0, V <sub>VM</sub> = 13.5 V, T <sub>A</sub> = 125°C <sup>(1)</sup>			25	
V <sub>DVDD</sub>	Internal logic regulator voltage	2-mA load	3	3.3	3.5	V
		30-mA load, V <sub>VM</sub> = 13.5 V	2.9	3.2	3.5	
V <sub>AVDD</sub>	Internal logic regulator voltage	2-mA load	4.7	5	5.3	V
		30-mA load, V <sub>VM</sub> = 13.5 V	4.6	5	5.3	
CHARGE PUMP (VCP, CPH, CPL)						
V <sub>VCP</sub>	VCP operating voltage	V <sub>VM</sub> = 13.5 V; I <sub>VCP</sub> = 0 to 12 mA	22.5	23.5	24.5	V
		V <sub>VM</sub> = 8 V; I <sub>VCP</sub> = 0 to 10 mA	13.7	14	14.8	
		V <sub>VM</sub> = 5.5 V; I <sub>VCP</sub> = 0 to 8 mA	8.9	9.1	9.5	
I <sub>VCP</sub>	Charge-pump current capacity	V <sub>VM</sub> > 13.5 V	12			mA
		8 V < V <sub>VM</sub> < 13.5 V	10			
		5.5 V < V <sub>VM</sub> < 8 V	8			
CONTROL INPUTS (IN1, IN2, nSLEEP, MODE, nSCS, SCLK, SDI, PH, EN)						
V <sub>IL</sub>	Input logic-low voltage		0		0.8	V

(1) Ensured by design and characterization data.

## 8 Detailed Description

### 8.1 Overview

The DRV870x-Q1 device is an H-bridge gate driver (also called a gate controller). The device integrates FET gate drivers to control four external NMOS FETs. The device is capable of driving each half-bridge independently. The device can be powered with a supply voltage from 5.5 V to 45 V.

A configurable PH/EN, independent half-bridge control, or PWM interface allows easy interfacing to the controller circuit.

The device has a low-power sleep mode that is enabled using the nSLEEP pin.

The gate drive strength can be adjusted to optimize a system for a given FET size without adding external series resistors. The IDRIVE pin allows for selection of the peak current driven into the external FET gate. Both the high-side and low-side FETs are driven with a gate source voltage ( $V_{GS}$ ) of 10.5 V (nominal) when the VM voltage is more than 13.5 V. At lower VM voltages, the  $V_{GS}$  is reduced. The high-side gate drive voltage is generated using a doubler-architecture charge pump that regulates to the  $VM + 10.5$  V.

This device significantly reduces the component count of discrete motor-driver systems by integrating the required FET drive circuitry into a single device. The DRV870x-Q1 device also has protection features beyond traditional discrete implementations including: undervoltage lockout (UVLO), overcurrent protection (OCP), gate-driver faults, and thermal shutdown (TSD).

A start-up (inrush) or running current limitation is built in using a fixed time-off current chopping scheme. The chopping current level is set by selecting the value of the sense resistor and setting a voltage on the VREF pin.

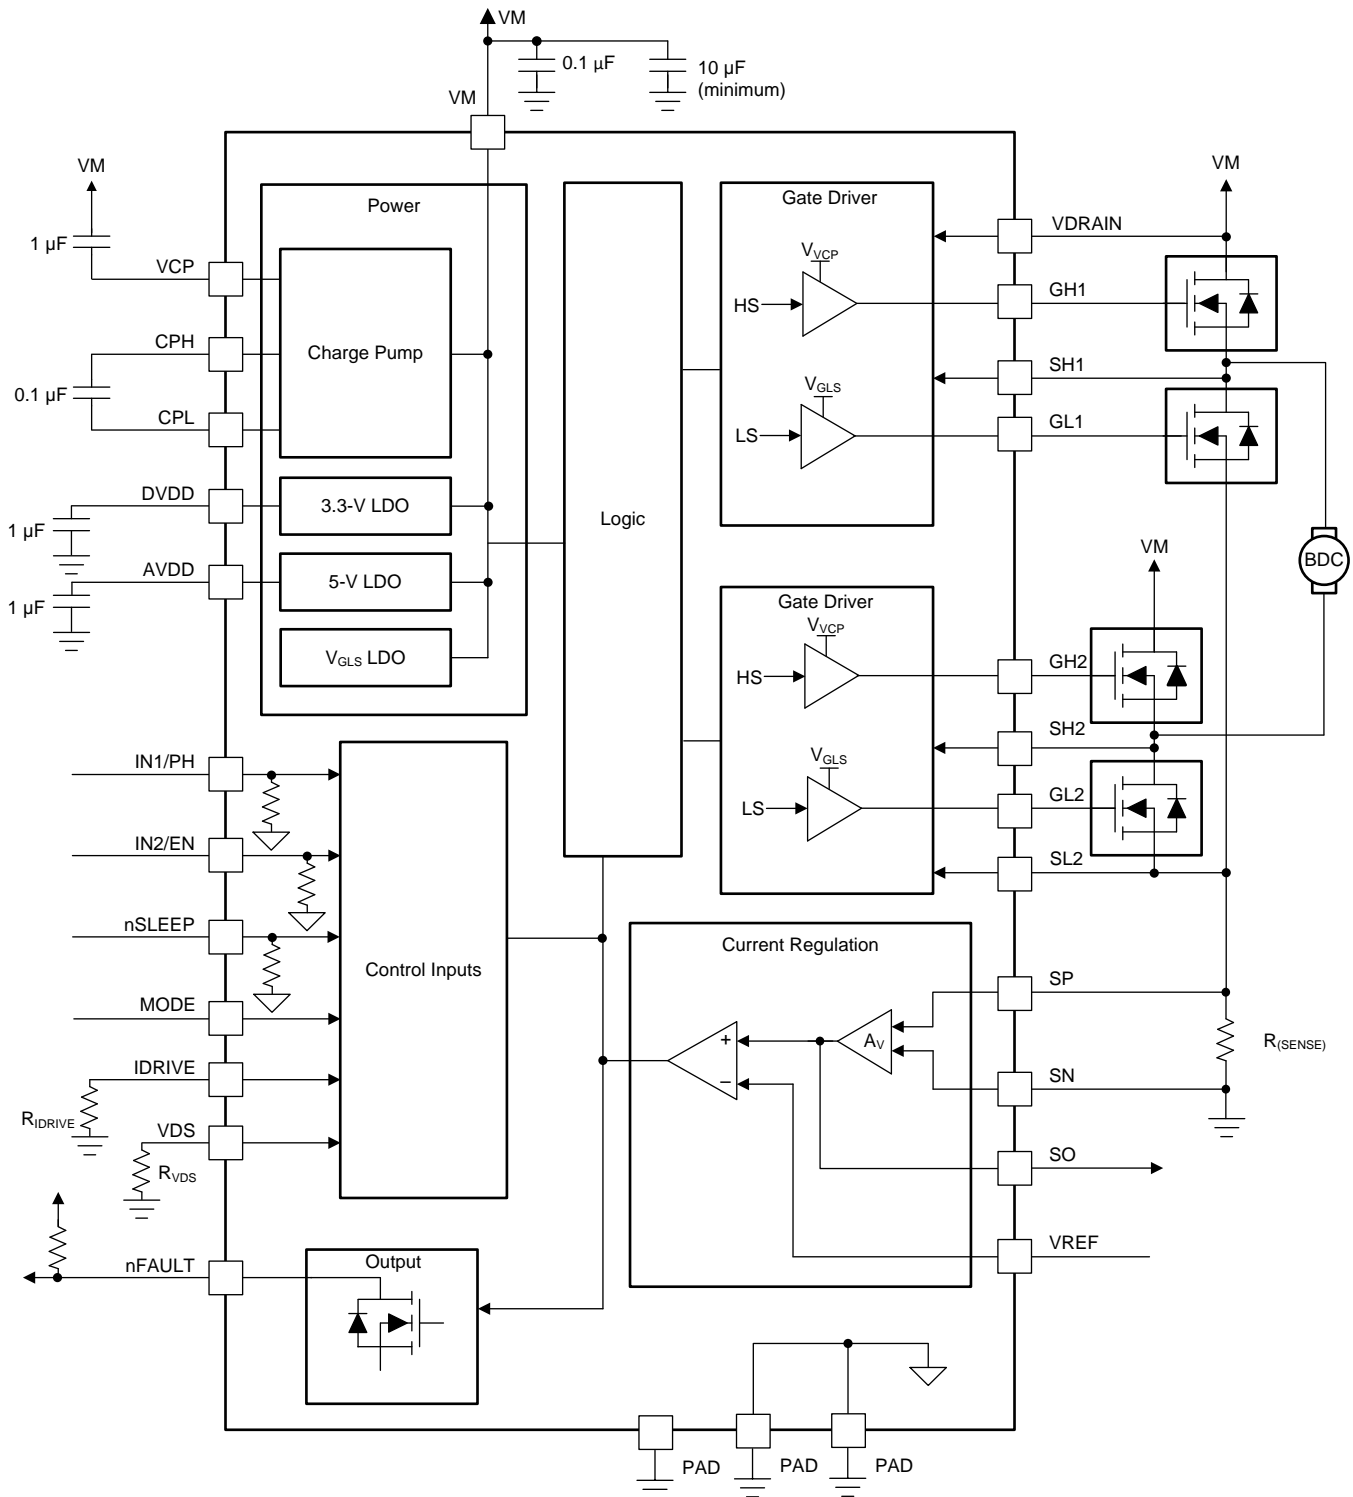

A shunt-amplifier output provides accurate current measurements by the system controller. The SO pin outputs a voltage that is approximately 20 times the voltage across the sense resistor on the DRV8702-Q1 device. For the DRV8703-Q1, this gain is configurable.

### 8.3 Feature Description

[Table 1](#) and [Table 2](#) list the recommended external components for the device.

**Table 1. External Components**

COMPONENT	PIN 1	PIN 2	RECOMMENDED
$C_{(VM1)}$	VM	GND	0.1- $\mu$ F ceramic capacitor rated for VM
$C_{(VM2)}$	VM	GND	$\geq 10$ - $\mu$ F electrolytic capacitor rated for VM
$C_{(VCP)}$	VCP	VM	16-V, 1- $\mu$ F ceramic capacitor
$C_{(SW)}$	CPH	CPL	0.1- $\mu$ F X7R capacitor rated for VM
$C_{(DVDD)}$	DVDD	GND	6.3-V, 1- $\mu$ F ceramic capacitor
$C_{(AVDD)}$	AVDD	GND	6.3-V, 1- $\mu$ F ceramic capacitor
$R_{(IDRIVE)}$	IDRIVE	GND	For resistor sizing, see the <a href="#">Typical Application</a> section
$R_{(VDS)}$	VDS	GND	For resistor sizing, see the <a href="#">Typical Application</a> section
$R_{(nFAULT)}$	$V_{CC}^{(1)}$	nFAULT	$\geq 10$ k $\Omega$
$R_{(nWDFLT)}$	$V_{CC}^{(1)}$	nWDFLT	$\geq 10$ k $\Omega$
$R_{(SENSE)}$	SP	SN or GND	Optional low-side sense resistor
$R_{(VDRAIN)}^{(2)}$	VDRAIN	VM	100- $\Omega$ series resistor

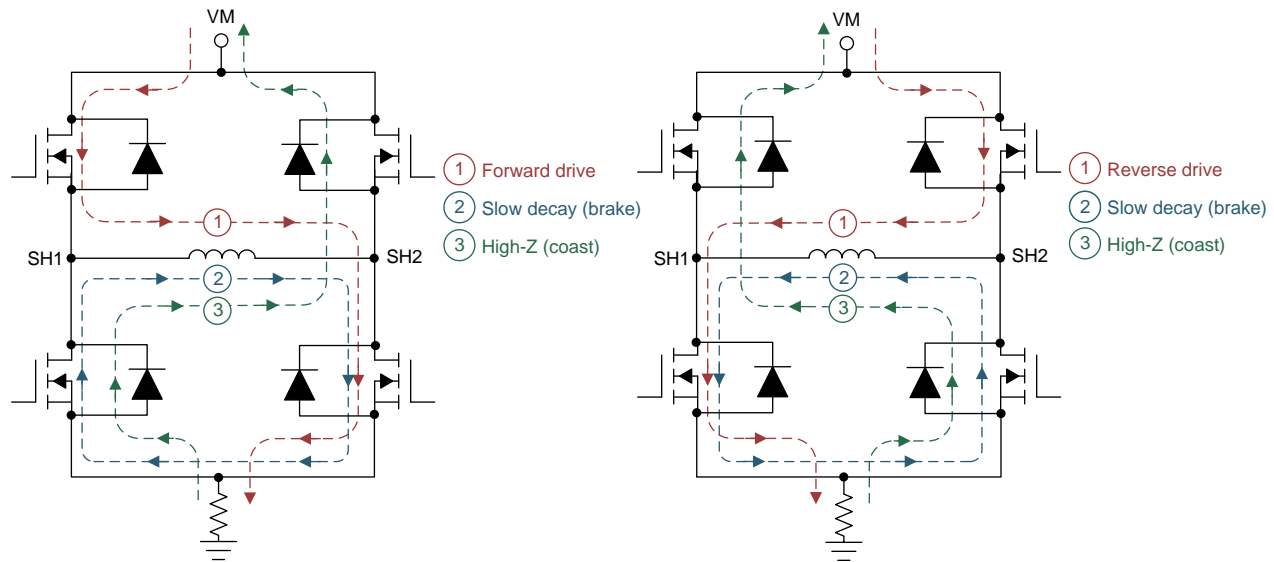

- (1) The  $V_{CC}$  pin is not a pin on the DRV870x-Q1, but a  $V_{CC}$  supply voltage pullup is required for open-drain outputs nFAULT. These pins can be pulled up to either AVDD or DVDD.
- (2) The  $R_{(VDRAIN)}$  resistor should be used between the VDRAIN and VM pins to minimize current to the VDRAIN pin if no external reverse battery protection is implemented on the VDRAIN pin.

**Table 2. External Gates**

COMPONENT	GATE	DRAIN	SOURCE	RECOMMENDED
$Q_{(HS1)}$	GH1	VM	SH1	Supports FETs up to 200 nC at 40 kHz PWM For more information, see <a href="#">Application and Implementation</a>
$Q_{(LS1)}$	GL1	SH1	SP or GND	
$Q_{(HS2)}$	GH2	VM	SH2	
$Q_{(LS2)}$	GL2	SH2	SP or GND	

#### 8.3.1 Bridge Control

The DRV870x-Q1 device is controlled using a configurable input interface. The [Logic Tables](#) section provides the full H-bridge state. These tables do not consider the current control built into the DRV870x-Q1 device. Positive current is defined in the direction of SH1  $\rightarrow$  SH2. The logic operation set by the MODE pin is latched on power-up or when exiting sleep mode.

**Figure 31. Bridge Control**

### 8.3.1.1 Logic Tables

Table 3, Table 4, and Table 5 are the device logic tables. An X denotes a don't care input or output.

**Table 3. DRV870x-Q1 PH and EN Control Interface (MODE = 0)**

nSLEEP	IN1/PH	IN2/EN	GH1	GL1	SH1	GH2	GL2	SH2	AVDD/DVDD	DESCRIPTION
0	X	X	X	X	Hi-Z	X	X	Hi-Z	Disabled	Sleep mode H bridge disabled Hi-Z
1	X	0	0	1	L	0	1	L	Enabled	Brake low-side slow decay
1	0	1	0	1	L	1	0	H	Enabled	Reverse (Current SH2 → SH1)
1	1	1	1	0	H	0	1	L	Enabled	Forward (Current SH1 → SH2)

**Table 4. DRV870x-Q1 Independent PWM Control Interface (MODE = 1)**

nSLEEP	IN1/PH	IN2/EN	GH1	GL1	SH1	GH2	GL2	SH2	AVDD/DVDD	DESCRIPTION
0	X	X	X	X	Hi-Z	X	X	Hi-Z	Disabled	Sleep mode H bridge disabled Hi-Z
1	0	0	0	0	Hi-Z	0	0	Hi-Z	Enabled	Coast H bridge disabled Hi-Z
1	0	1	0	1	L	1	0	H	Enabled	Reverse (Current SH2 → SH1)
1	1	0	1	0	H	0	1	L	Enabled	Forward (Current SH1 → SH2)
1	1	1	0	1	L	0	1	L	Enabled	Brake low-side slow decay

### 8.3.2 MODE Pin

The MODE pin of the device determines the control interface and latches on power-up or when exiting sleep mode. [Figure 32](#) shows an overview of the internal circuit of the MODE pin.

**Figure 32. MODE Pin Block Diagram**

[Table 6](#) lists the different control interfaces that can be set via MODE pin at power-up or when exiting sleep mode.

**Table 6. MODE Pin Configuration**

MODE	CONTROL INTERFACE
0	PH or EN
1	Independent half-bridge
Hi-Z	PWM

During the device power-up sequence, the DVDD pin is enabled first. Then the MODE pin latches. Finally the AVDD pin is enabled. For setting PWM control interface, TI does not recommended connecting the MODE pin to the AVDD pin. Instead the MODE pin should be connected to an external 5-V or 3.3-V supply or to the DVDD pin if not driven by an external microcontroller (MCU).

### 8.3.3 nFAULT Pin

The nFAULT pin has an open-drain output and should be pulled up to a 5-V or 3.3-V supply. When a fault is detected, the nFAULT line is logic low.

**Figure 33. nFAULT Block Diagram**

For a 3.3-V pullup the nFAULT pin can be tied to the DVDD pin with a resistor (refer to the [Application and Implementation](#) section). For a 5-V pullup an external 5-V supply should be used. TI does not recommended connecting the nFAULT pin to the AVDD pin.

### 8.3.4 Current Regulation

The maximum current through the motor winding is regulated by a fixed off-time PWM current regulation or current chopping. When an H-bridge is enabled in forward or reverse drive, current rises through the winding at a rate dependent on the DC voltage and inductance of the winding. When the current hits the current chopping threshold, the bridge enters a brake (low-side slow decay) mode until the  $t_{off}$  time expires.

### NOTE

Immediately after the current is enabled, the voltage on the SP pin is ignored for a period ( $t_{\text{BLANK}}$ ) before enabling the current-sense circuitry.

The PWM chopping current is set by a comparator that compares the voltage across a current-sense resistor connected to the SP pin, multiplied by a factor of  $A_V$ , with a reference voltage from the VREF pin. The factor  $A_V$  is the shunt-amplifier gain, which is 19.8 V/V for the DRV8702-Q1 device or configurable to 10, 19.8, 39.4, or 78 V/V for the DRV8703-Q1 device.

Use Equation 1 to calculate the chopping current ( $I_{\text{CHOP}}$ ).

$$I_{\text{CHOP}} = \frac{V_{\text{VREF}} - V_{\text{IO}} \times A_V}{A_V \times R_{\text{(SENSE)}}} \quad (1)$$

For example, if a 50-mΩ sense resistor and a VREF value of 3.3 V are selected, the full-scale chopping current is 3.28 A. The  $A_V$  is 19.8 V/V and  $V_{\text{IO}}$  is assumed to be 50 mV in this example.

For DC motors, current regulation is used to limit the start-up and stall current of the motor. If the current regulation feature is not needed, it can be disabled by tying the VREF pin directly to the AVDD pin. If the independent PWM control-interface mode (MODE pin is 1) is selected for operation, the device does not perform PWM current regulation or current chopping.

### 8.3.5 Amplifier Output (SO)

The SO pin on the DRV870x-Q1 device outputs an analog voltage equal to the voltage across the SP and SN pins multiplied by  $A_V$ . The SO voltage is only valid for forward or reverse drive. Use Equation 2 to calculate the approximate current for the H-bridge.

$$I = \frac{V_{\text{SO}} - V_{\text{IO}} \times A_V}{A_V \times R_{\text{(SENSE)}}} \quad (2)$$

When the SP and SN voltages are 0 V, the SO pin outputs the amplifier offset voltage,  $V_{\text{IO}}$ . No capacitor is required on the SO pin.

**Figure 34. Current Sense Amplifier Output**

If the voltage across the SP and SN pins exceeds 1 V, then the DRV870x-Q1 device flags an overcurrent condition.

The SO pin can source up to 5 mA of current. If the pin is shorted to ground, or if this pin drives a higher current load, the output functions as a constant-current source. The output voltage is not representative of the H-bridge current in this state.

**Figure 35. Current Sense Amplifier and Current Chopping Operation**

During brake mode (slow decay), current is circulated through the low-side FETs. Because current is not flowing through the sense resistor, the SO pin does not represent the motor current.

### 8.3.5.1 SO Sample and Hold Operation

The DRV8703-Q1 device allows the shunt amplifier to operate in a sample and hold configuration. To enable this mode, set the SH\_EN bit high through the SPI. In this mode, the shunt amplifier output is disabled to the Hi-Z state whenever the driver is in a brake mode. Place an external capacitor on this pin.

**Figure 36. Sample and Hold Operation**

### 8.3.6 PWM Motor Gate Drivers

The DRV870x-Q1 device has gate drivers for a single H-bridge with external NMOS FETs. Figure 37 shows a block diagram of the predrive circuitry.

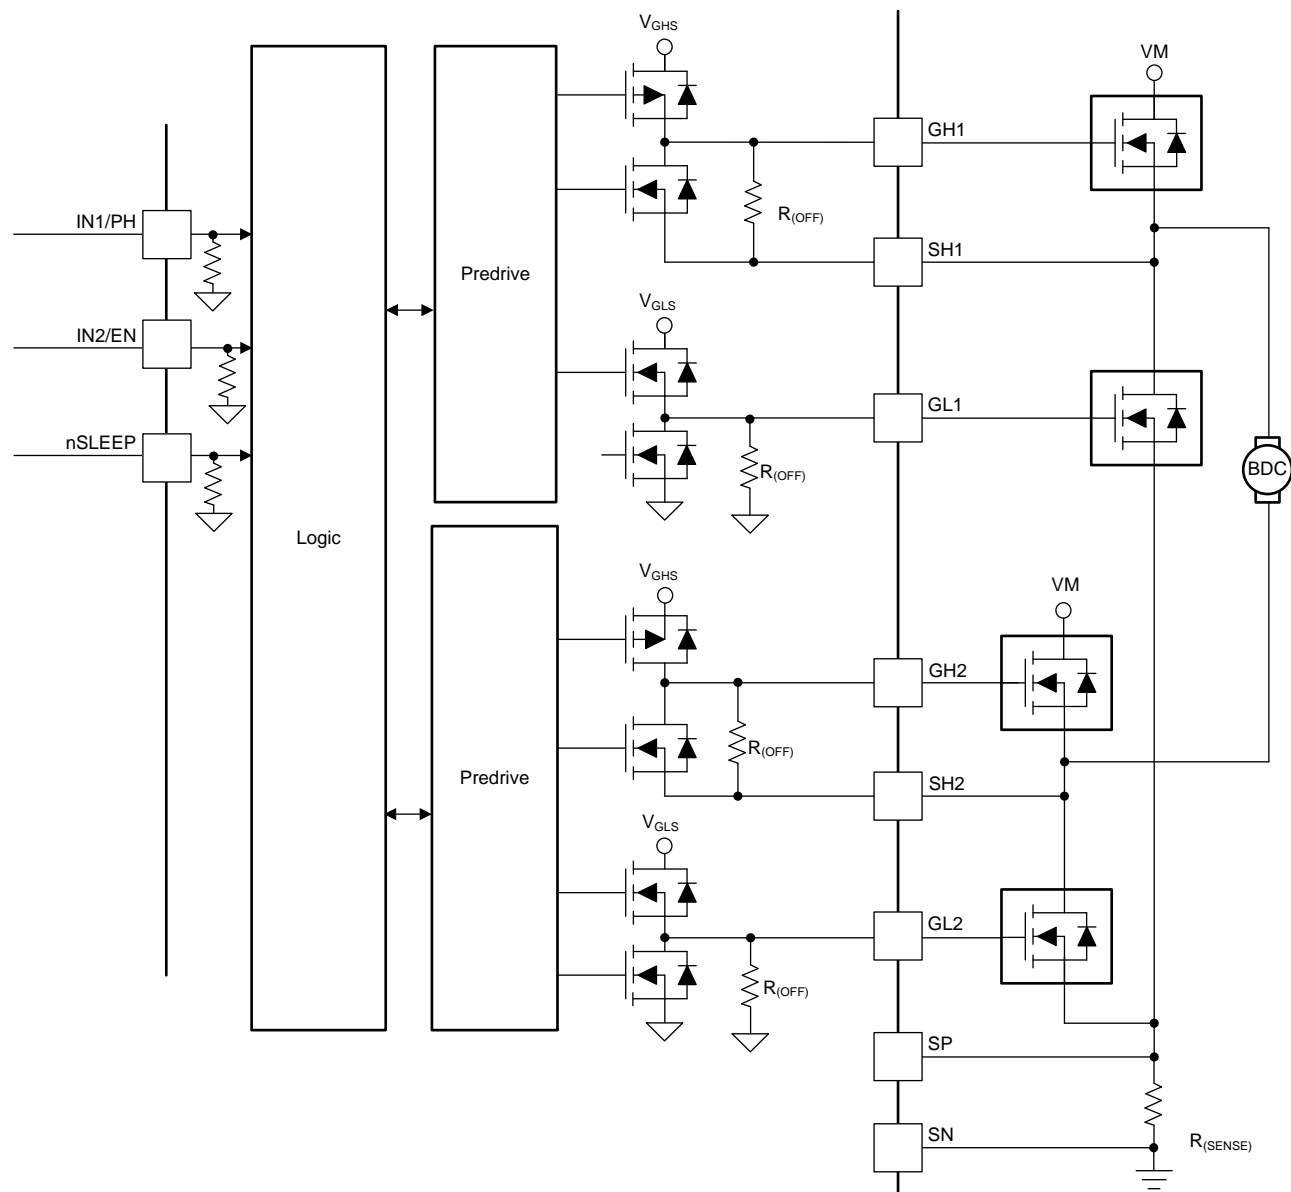

Figure 37. Predrive Block Diagram

Gate drivers inside the DRV870x-Q1 device directly drive N-Channel MOSFETs, which drive the motor current. The high-side gate drive is supplied by the charge pump, while an internal regulator generates the low-side gate drive.

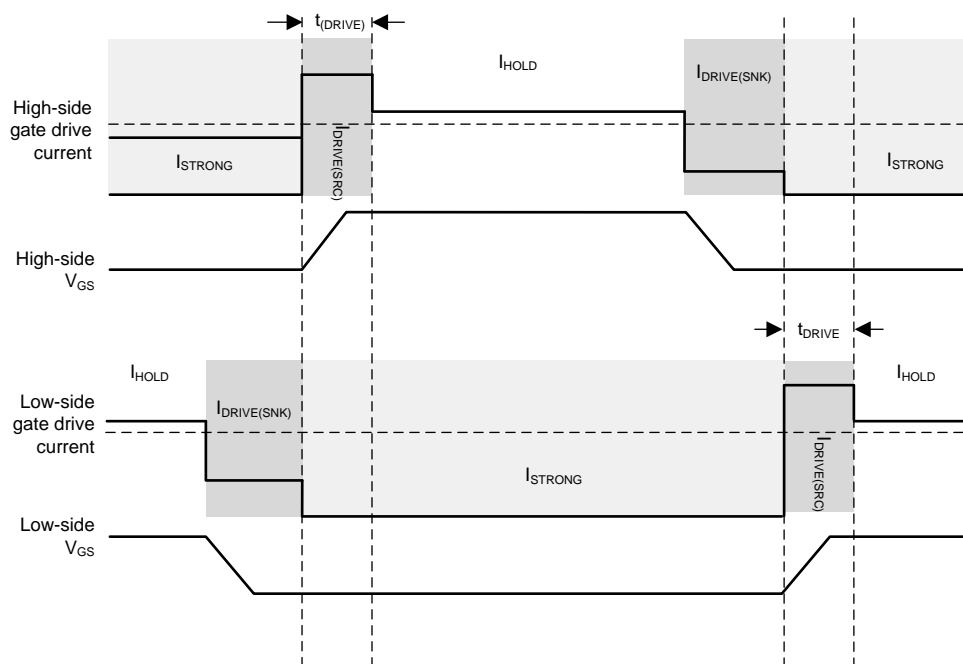

The peak drive current of the gate drivers is adjustable through the IDRIVE pin for DRV8702-Q1 device or the IDRIVE register for the DRV8703-Q1 device. Peak source currents can be set to the values listed in the FET gate drivers section of the [Electrical Characteristics](#) table. The peak sink current is approximately two times the peak source current. Adjusting the peak current changes the output slew rate, which also depends on the FET input capacitance and gate charge.

Fast switching times can cause extra noise on the VM and GND pins. This additional noise can occur specifically because of a relatively slow reverse-recovery time of the low-side body diode, when the body diode conducts reverse-bias momentarily, similar to shoot-through. Slow switching times can cause excessive power dissipation because the external FETs have a longer turnon and turnoff time.

When changing the state of the output, the peak current ( $I_{\text{DRIVE}}$ ) is applied for a short period ( $t_{\text{DRIVE}}$ ), to charge the gate capacitance. After this time, a weak current source ( $I_{\text{HOLD}}$ ) is used to keep the gate at the desired state. When selecting the gate drive strength for a given external FET, the selected current must be high enough to charge fully and discharge the gate during  $t_{\text{DRIVE}}$ , or excessive power is dissipated in the FET.

During high-side turnon, the low-side gate is pulled low with a strong pulldown ( $I_{\text{STRONG}}$ ). This pulldown prevents the low-side FET  $Q_{\text{GS}}$  from charging and keeps the FET off, even when fast switching occurs at the outputs.

The gate-driver circuits include enforcement of a dead time in analog circuitry, which prevents the high-side and low-side FETs from conducting at the same time. When the switching FETs are on, this handshaking prevents the high-side or low-side FET from turning on until the opposite FET turns off.

**Figure 38. Gate Driver Output to Control External FETs**

### 8.3.6.1 Miller Charge ( $Q_{GD}$ )

When a FET gate turns on, the following capacitances must be charged:

- Gate-to-source charge,  $Q_{GS}$
- Gate-to-drain charge,  $Q_{GD}$  (Miller charge)
- Remaining  $Q_G$

The FET output is slewing primarily during the  $Q_{GD}$  charge.

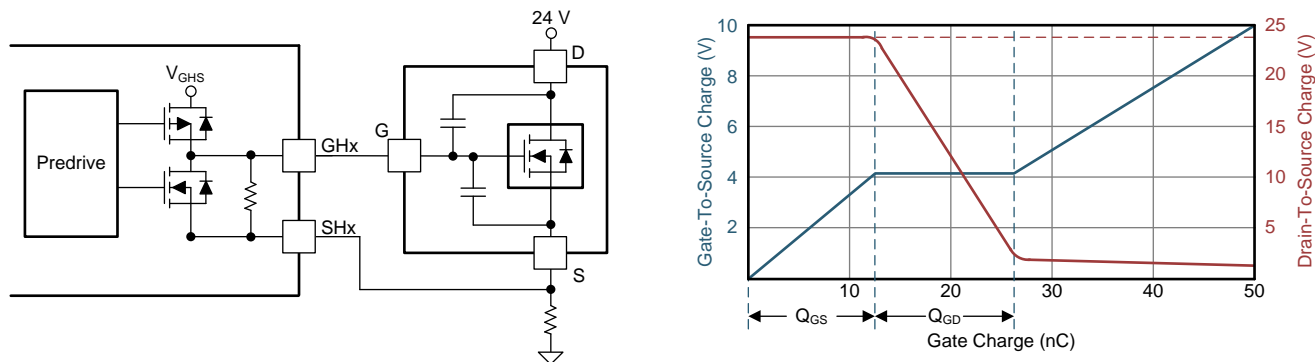

Figure 39. FET Gate Charging Profile

### 8.3.7 IDRIVE Pin (DRV8702-Q1 Only)

The rise and fall times of the H-bridge output (SHx pins) can be adjusted by setting the IDRIVE resistor value or forcing a voltage onto the IDRIVE pin. The FET gate voltage ramps faster if a higher IDRIVE setting is selected. The ramp of the FET gate directly affects the rise and fall times of the H-bridge output.

Tying the IDRIVE pin to ground selects the lowest drive setting of 10-mA source and 20-mA sink. Leaving this pin open selects the drive setting of 155-mA high side and 130-mA low side for source current, and 265-mA high side, 260-mA low side for sink current, at a VM voltage of 13.5 V. For a detailed list of IDRIVE configurations, see [Table 7](#).

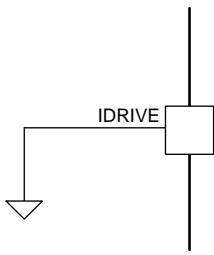

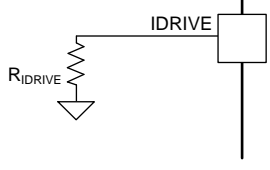

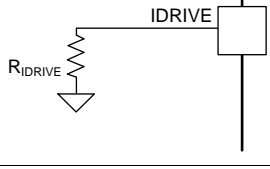

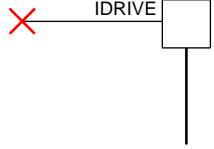

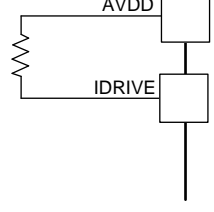

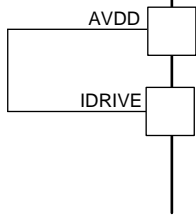

Figure 40. IDRIVE Pin Internal Circuitry

# DRV8702-Q1, DRV8703-Q1

SLVSDR9C – OCTOBER 2016 – REVISED AUGUST 2018

## Table 7. DRV8702-Q1 IDRIVE Settings

IDRIVE RESISTANCE	IDRIVE VOLTAGE	SOURCE CURRENT		SINK CURRENT		CIRCUIT
		$V_{VM} = 5.5\text{ V}$	$V_{VM} = 13.5\text{ V}$	$V_{VM} = 5.5\text{ V}$	$V_{VM} = 13.5\text{ V}$	
< 1 k $\Omega$ to GND	GND	High-side: 10 mA Low-side: 10 mA	High-side: 10 mA Low-side: 10 mA	High-side: 20 mA Low-side: 20 mA	High-side: 20 mA Low-side: 20 mA	
33 k $\Omega \pm 5\%$ to GND	0.7 V $\pm 5\%$	High-side: 20 mA Low-side: 20 mA	High-side: 20 mA Low-side: 20 mA	High-side: 40 mA Low-side: 40 mA	High-side: 40 mA Low-side: 40 mA	
200 k $\Omega \pm 5\%$ to GND	2 V $\pm 5\%$	High-side: 50 mA Low-side: 40 mA	High-side: 50 mA Low-side: 45 mA	High-side: 90 mA Low-side: 85 mA	High-side: 95 mA Low-side: 95 mA	
> 2 M $\Omega$ to GND, Hi-Z	3 V $\pm 5\%$	High-side: 145 mA Low-side: 115 mA	High-side: 155 mA Low-side: 130 mA	High-side: 250 mA Low-side: 235 mA	High-side: 265 mA Low-side: 260 mA	
68 k $\Omega \pm 5\%$ to AVDD	4 V $\pm 5\%$	High-side: 190 mA Low-side: 145 mA	High-side: 210 mA Low-side: 180 mA	High-side: 330 mA Low-side: 300 mA	High-side: 350 mA Low-side: 350 mA	
< 1 k $\Omega$ to AVDD	AVDD	High-side: 240 mA Low-side: 190 mA	High-side: 260 mA Low-side: 225 mA	High-side: 420 mA Low-side: 360 mA	High-side: 440 mA Low-side: 430 mA	

### 8.3.8 Dead Time

The dead time ( $t_{\text{DEAD}}$ ) is measured as the time when the SHx pin is in the Hi-Z state between turning off one of the H-bridge FETs and turning on the other. For example, the output is Hi-Z between turning off the high-side FET and turning on the low-side FET.

The dead time consists of an inserted digital dead time and FET gate slewing. The DRV8702-Q1 device has a digital dead time of approximately 240 ns. The DRV8703-Q1 device has programmable dead-time options of 120, 240, 480, 960 ns. In addition to this digital dead time, the output is Hi-Z as long as the voltage across the GLx pin to ground or GHx pin to SHx pin is less than the FET threshold voltage.

The total dead time is dependent on the IDRIVE resistor setting because a portion of the FET gate ramp (GHx and GLx pins) includes the observable dead time.

### 8.3.9 Propagation Delay

The propagation delay time ( $t_{\text{PD}}$ ) is measured as the time between an input edge to an output change. This time is composed of two parts: an input deglitcher and output slewing delay. The input deglitcher prevents noise on the input pins from affecting the output state.

The gate drive slew rate also contributes to the delay time. For the output to change state during normal operation, one FET must first be turned off. The FET gate is ramped down according to the IDRIVE resistor selection, and the observed propagation delay ends when the FET gate falls below the threshold voltage.

### 8.3.10 Overcurrent VDS Monitor

The gate-driver circuit monitors the VDS voltage of each external FET when it is driving current. When the voltage monitored is greater than the OCP threshold voltage ( $V_{\text{DS(OC)}})$  after the OCP deglitch time has expired, an OCP condition is detected. The VDS voltage can be adjusted by changing the resistor ( $R_{\text{(VDS)}}$ ) on the VDS pin of the DRV8702-Q1 device. The DRV8703-Q1 device provides VDS voltage levels by setting the VDS register.

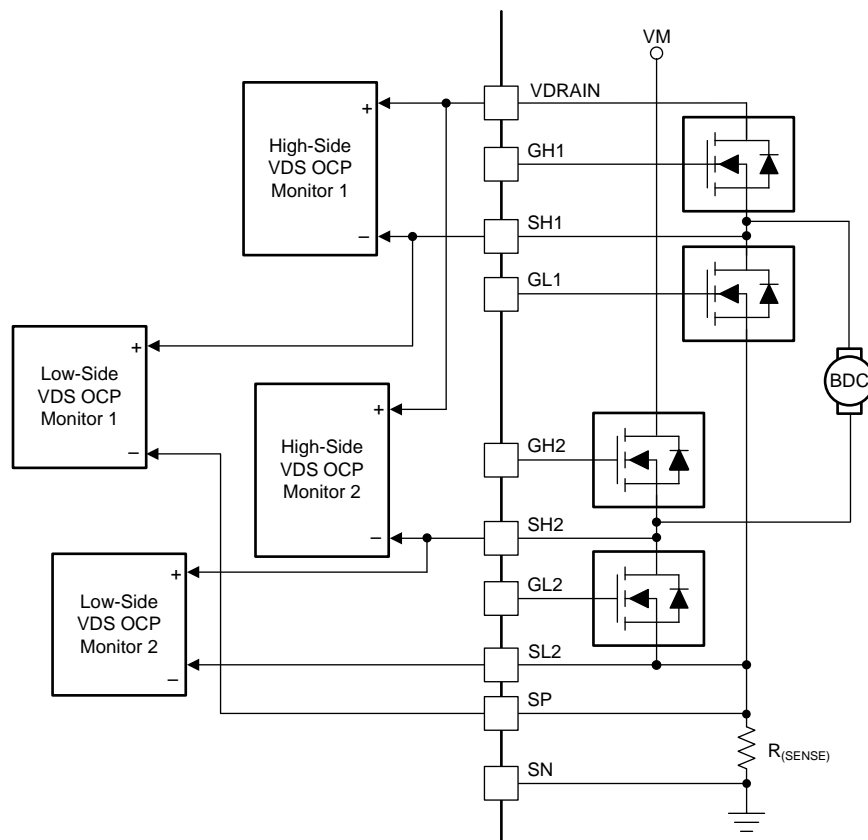

Figure 41.  $V_{\text{DS(OC)}}$  Block Diagram

## DRV8702-Q1, DRV8703-Q1

SLVSDR9C – OCTOBER 2016 – REVISED AUGUST 2018

[www.ti.com](http://www.ti.com)

The VDS voltage on the high-side FET is measured across the VDRAIN to SHx pins. The low-side VDS monitor on half-bridge 1 measures the VDS voltage across the SH1 to SP pins. The low-side VDS monitor on half-bridge 2 measures the VDS voltage across the SH2 to SL2 pins. Ensure that the SP pin is always connected to the source of the low-side FET of half-bridge 1, even when the sense amplifier is not used.

### 8.3.11 VDS Pin (DRV8702-Q1 Only)

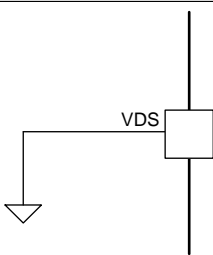

The VDS pin on the DRV8702-Q1 device is used to select the VDS threshold voltage for overcurrent detection.

Tying the VDS pin to ground selects the lowest setting of 0.06 V. Leaving this pin open selects the setting of 0.48 V. Tying the VDS pin to the AVDD the pin disables the VDS monitor. For a detailed list of VDS configurations, see [Table 8](#).

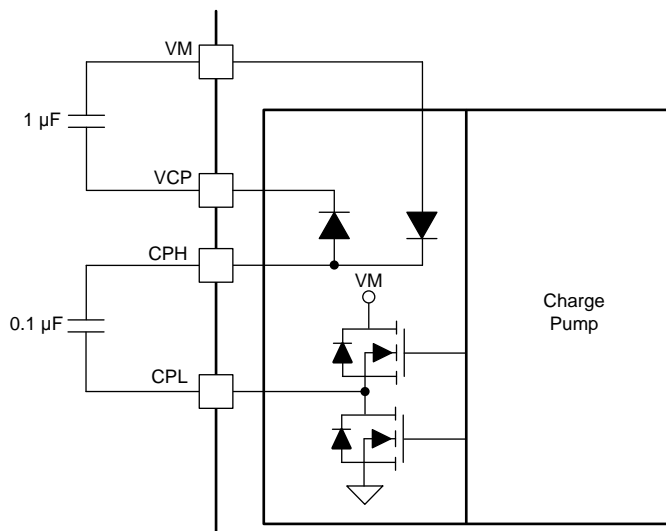

**Figure 42. VDS Block Diagram**

**Table 8. VDS Pin Resistor Setting**

VDS RESISTANCE	VDS VOLTAGE	OVERCURRENT TRIP LEVEL ( $V_{DS(OCp)}$ )	CIRCUIT
< 1 k $\Omega$ to GND	GND	0.06 V	
33 k $\Omega$ $\pm$ 5% to GND	0.7 V $\pm$ 5%	0.12 V	
200 k $\Omega$ $\pm$ 5% to GND	2 V $\pm$ 5%	0.24 V	
> 2 M $\Omega$ to GND, Hi-Z	3 V $\pm$ 5%	0.48 V	
68 k $\Omega$ $\pm$ 5% to AVDD	4 V $\pm$ 5%	0.96 V	
< 1 k $\Omega$ to AVDD	AVDD	Disabled	

### 8.3.12 Charge Pump

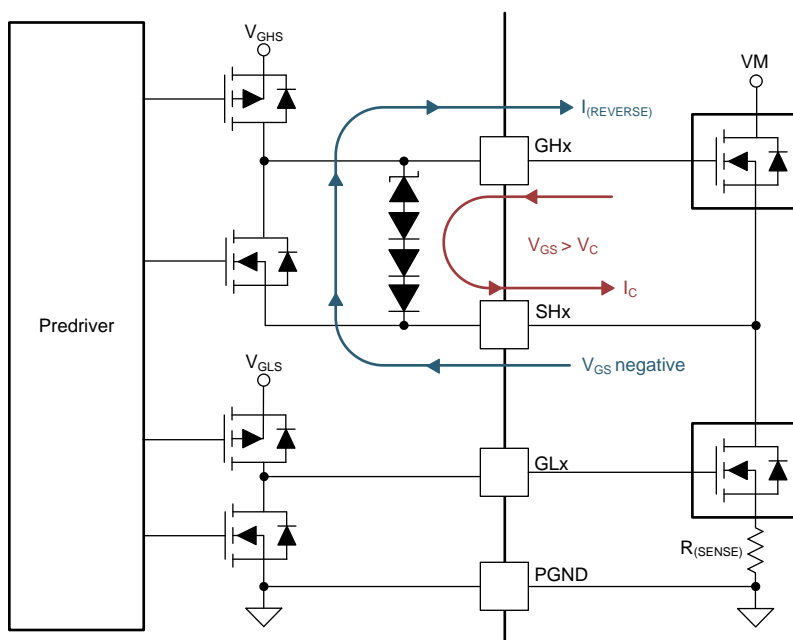

A charge pump is integrated to supply the gate drive voltage of a high-side NMOS ( $V_{GS_H}$ ). The charge pump requires a capacitor between the VM and VCP pins. Additionally, a low-ESR ceramic capacitor is required between the CPH and CPL pins. When the VM voltage is below 13.5 V, this charge pump functions as a doubler and generates a  $V_{VCP}$  equal to  $2 \times V_{VM} - 1.5$  V if unloaded. When the VM voltage is more than 13.5 V, the charge pump regulates  $V_{VCP}$  such that it is equal to  $V_{VM} + 10.5$  V.

**Figure 43. Charge Pump Block Diagram**

### 8.3.13 Gate Drive Clamp

A clamping structure limits the gate-drive output voltage to the  $V_{C(GS)}$  voltage to protect the power FETs from damage. The positive voltage clamp is realized using a series of diodes. The negative voltage clamp uses the body diodes of the internal predriver FET.

**Figure 44. Gate Drive Clamp**

### 8.3.14 Protection Circuits

The DRV870x-Q1 device is fully protected against VM undervoltage, charge-pump undervoltage, overcurrent, gate-driver shorts, and overtemperature events.

#### 8.3.14.1 VM Undervoltage Lockout (UVLO2)

If the voltage on the VM pin falls below the VM undervoltage lockout threshold voltage ( $V_{UVLO2}$ ), all FETs in the H-bridge are disabled, the charge pump is disabled, and the nFAULT pin is driven low. The VM\_UVFL bit of the DRV8703-Q1 device is set. The operation resumes when the VM voltage rises above the UVLO2 threshold. The nFAULT pin is released after the operation resumes but the VM\_UVFL bit on the DRV8703-Q1 device remains set until cleared by writing to the CLR\_FLT bit.

The SPI settings on the DRV8703-Q1 device are not reset by this fault even though the output drivers are disabled. The settings are maintained and internal logic remains active until the VM voltage falls below the logic undervoltage threshold ( $V_{UVLO1}$ ).

#### 8.3.14.2 Logic Undervoltage (UVLO1)

If the voltage on the VM pin falls below the logic undervoltage threshold voltage ( $V_{UVLO1}$ ), the internal logic is reset. The operation resumes when the VM voltage rises above the UVLO1 threshold. The nFAULT pin is logic low during this state because it is pulled low when the VM undervoltage condition occurs. Decreasing the VM voltage below this undervoltage threshold resets the SPI settings.

#### 8.3.14.3 VCP Undervoltage Lockout (CPUV)

If the voltage on the VCP pin falls below the threshold voltage of the charge-pump undervoltage (CPUV) lockout, all FETs in the H-bridge are disabled and the nFAULT pin is driven low. The DRV8703-Q1 the VCP\_UVFL bit is set. The operation resumes when the VCP voltage rises above the CPUV threshold. The nFAULT pin is released after the operation resumes but the VCP\_UVFL bit on the DRV8703-Q1 device remains set until cleared by writing to the CLR\_FLT bit.

#### 8.3.14.4 Overcurrent Protection (OCP)

Overcurrent is sensed by monitoring the VDS voltage drop across the external FETs. If the voltage across a driven FET exceeds the  $V_{DS(OC)}$  level for longer than the OCP deglitch time, an OCP event is recognized. All FETs in the H-bridge are disabled, and the nFAULT pin is driven low. The OCP bit of the DRV8703-Q1 device is set. The drive re-enables after the  $t_{(RETRY)}$  time has passed. The nFAULT pin becomes high again after the retry time.

If the fault condition is still present, the cycle repeats. If the fault is no longer present, normal operation resumes and the nFAULT pin goes high. The OCP bit on the DRV8703-Q1 remains set until cleared by writing to the CLR\_FLT bit. In addition to this FET VDS monitor, an overcurrent condition is detected if the voltage at the SP pin exceeds  $V_{SP(OC)}$  and the nFAULT pin is driven low. The OCP bit in the DRV8703-Q1 device is set.

#### 8.3.14.5 Gate Driver Fault (GDF)

The GHx and GLx pins are monitored such that if the voltage on the external FET gate does not increase or decrease after the  $t_{(DRIVE)}$  time, a gate driver fault is detected. This fault occurs if the GHx or GLx pins are shorted to the GND, SHx, or VM pin. Additionally, a gate-driver fault occurs if the selected IDRIVE setting is not sufficient to turn on the external FET. All FETs in the H-bridge are disabled, and the nFAULT pin is driven low. The GDF bit of the DRV8703-Q1 device is set. The driver re-enables after the OCP retry period ( $t_{(RETRY)}$ ) has passed. The nFAULT pin is released after the operation has resumed but the GDF bit on the DRV8703-Q1 device remains set until cleared by writing to the CLR\_FLT bit.

#### 8.3.14.6 Thermal Shutdown (TSD)

If the die temperature exceeds the  $T_{SD}$  temperature, all FETs in the H-bridge are disabled, the charge pump shuts down, the AVDD regulator is disabled, and the nFAULT pin is driven low. The OTSD bit of the DRV8703-Q1 device is set as well. After the die temperature falls below  $T_{SD} - T_{hys}$  temperature, device operation automatically resumes. The nFAULT pin is released after the operation resumes, but the OTSD bit on the DRV8703-Q1 device remains set until cleared by writing to the CLR\_FLT bit.

### 8.3.14.7 Watchdog Fault (WDFLT, DRV8703-Q1 Only)

An MCU watchdog function can be enabled to ensure that the external controller that is instructing the DRV8703-Q1 device is active and in a known state. The SPI watchdog must be enabled by writing a 1 to the WD\_EN bit through the SPI (disabled by default, bit is 0). When the watchdog is enabled, an internal timer starts to count down to an interval set by the WD\_DLY bits. The register address 0x00 must be read by the MCU within the interval set by the WD\_DLY bit to reset the watchdog. If the timer is allowed to expire, the nWDFLT pin is enabled. When the nWDFLT pin is enabled the following occurs:

- The nWDFLT pin goes low for 64  $\mu$ s.
- The nFAULT pin is asserted.
- The WD\_EN bit is cleared.
- The drivers are disabled.

The WDFLT bit remains asserted, and operation is halted until the CLR\_FLT bit has been written to 1.

Table 9 lists the fault responses of the device under the fault conditions.

**Table 9. Fault Response**

FAULT	CONDITION	H-BRIDGE	CHARGE PUMP	AVDD	DVDD	RECOVERY
VM undervoltage (UVLO)	$V_{VM} \leq V_{(UVLOx)}$ (5.45 V, max)	Disabled	Disabled	Disabled	Operating	$V_{VM} \geq V_{(UVLOx)}$ (5.65 V, max)
VCP undervoltage (CPUV)	$V_{VCP} \leq V_{(CP\_UV)}$ ( $V_{VM} + 1.5$ , typ)	Disabled	Operating	Operating	Operating	$V_{VCP} \geq V_{(CP\_UV)}$ ( $V_{VM} + 1.5$ , typ)
External FET overload (OCP)	$V_{DS} \geq V_{DS(OCP)}$ $V_{SP} - V_{SN} > 1$ V	Disabled	Operating	Operating	Operating	$t_{(RETRY)}$
Gate driver fault (GDF)	Gate voltage unchanged after $t_{(DRIVE)}$	Disabled	Operating	Operating	Operating	$t_{(RETRY)}$
Watchdog fault (WDFLT)	Watchdog timer expires	Disabled	Operating	Operating	Operating	CLR_FLT bit
Thermal shutdown (TSD)	$T_J \geq T_{SD}$ (150°C, min)	Disabled	Disabled	Disabled	Operating	$T_J \leq T_{SD} - T_{hys}$ ( $T_{hys}$ is typically 20°C)

## DRV8702-Q1, DRV8703-Q1

SLVSDR9C – OCTOBER 2016 – REVISED AUGUST 2018

[www.ti.com](http://www.ti.com)

### 8.3.15 Hardware Interface

The DRV8702-Q1 hardware interface allows the device to be configured without a SPI, however not all of the functionality is configurable like the DRV8703-Q1 device. The following configuration settings are fixed for the hardware-interface device option:

- The  $t_{off}$  value is set to 25  $\mu$ s.
- Current regulation is enabled
- The VREF pin voltage is not scaled internally (100%).
- The shunt amplifier has a fixed gain of 19.8 V/V.

#### 8.3.15.1 IDRIVE (6-level input)

The voltage or resistance on the IDRIVE pin sets the peak source and peak sink IDRIVE setting as listed in [Table 10](#).

**Table 10. DRV8702-Q1 IDRIVE Settings**

IDRIVE RESISTANCE	IDRIVE VOLTAGE	SOURCE CURRENT		SINK CURRENT	
		$V_{VM} = 5.5$ V	$V_{VM} = 13.5$ V	$V_{VM} = 5.5$ V	$V_{VM} = 13.5$ V
< 1 k $\Omega$ to GND	GND	High-side: 10 mA Low-side: 10 mA	High-side: 10 mA Low-side: 10 mA	High-side: 20 mA Low-side: 20 mA	High-side: 20 mA Low-side: 20 mA
33 k $\Omega \pm 5\%$ to GND	0.7 V $\pm 5\%$	High-side: 20 mA Low-side: 20 mA	High-side: 20 mA Low-side: 20 mA	High-side: 40 mA Low-side: 40 mA	High-side: 40 mA Low-side: 40 mA
200 k $\Omega \pm 5\%$ to GND	2 V $\pm 5\%$	High-side: 50 mA Low-side: 40 mA	High-side: 50 mA Low-side: 45 mA	High-side: 90 mA Low-side: 85 mA	High-side: 95 mA Low-side: 95 mA
> 2 M $\Omega$ to GND, Hi-Z	3 V $\pm 5\%$	High-side: 145 mA Low-side: 115 mA	High-side: 155 mA Low-side: 130 mA	High-side: 250 mA Low-side: 235 mA	High-side: 265 mA Low-side: 260 mA
68 k $\Omega \pm 5\%$ to AVDD	4 V $\pm 5\%$	High-side: 190 mA Low-side: 145 mA	High-side: 210 mA Low-side: 180 mA	High-side: 330 mA Low-side: 300 mA	High-side: 350 mA Low-side: 350 mA
< 1 k $\Omega$ to AVDD	AVDD	High-side: 240 mA Low-side: 190 mA	High-side: 260 mA Low-side: 225 mA	High-side: 420 mA Low-side: 360 mA	High-side: 440 mA Low-side: 430 mA

#### 8.3.15.2 VDS (6-Level Input)

This input controls the VDS monitor trip voltage as listed in [Table 11](#).

**Table 11. DRV8702-Q1 VDS Settings**

VDS RESISTANCE	VDS VOLTAGE	OVERCURRENT TRIP LEVEL ( $V_{DS(OCF)}$ )
< 1 k $\Omega$ to GND	GND	0.06 V
33 k $\Omega \pm 5\%$ to GND	0.7 V $\pm 5\%$	0.12 V
200 k $\Omega \pm 5\%$ to GND	2 V $\pm 5\%$	0.24 V
> 2 M $\Omega$ to GND, Hi-Z	3 V $\pm 5\%$	0.48 V
68 k $\Omega \pm 5\%$ to AVDD	4 V $\pm 5\%$	0.96 V
< 1 k $\Omega$ to AVDD	AVDD	Disabled

## 8.4 Device Functional Modes

The DRV870x-Q1 device is active unless the nSLEEP pin is brought low. In sleep mode, the charge pump is disabled, the H-bridge FETs are disabled to the Hi-Z state, and the AVDD and DVDD regulators are disabled.

### NOTE

The  $t_{\text{(SLEEP)}}$  time must elapse after a falling edge on the nSLEEP pin before the device is in sleep mode. The DRV870x-Q1 device is brought out of sleep mode automatically if the nSLEEP pin is brought high.

The  $t_{\text{(WAKE)}}$  time must elapse before the outputs change state after wakeup.

On the DRV8703-Q1 device, the SPI settings are reset when coming out of UVLO or exiting sleep mode.

While the nSLEEP pin is brought low, all external H-bridge FETs are disabled. The high-side gate pins, GHx, are pulled to the output node, SHx, by an internal resistor and the low-side gate pins, GLx, are pulled to ground.

When the VM voltage is not applied and during the power-on time ( $t_{\text{on}}$ ) the outputs are disabled using weak pulldown resistors between the GHx and SHx pins and the GLx and GND pins.

### NOTE

The MODE pin controls the device-logic operation for phase and enable, independent half-bridge, or PWM input modes. This operation is latched on power up or when exiting sleep mode.

## 8.5 Programming

### 8.5.1 SPI Communication

#### 8.5.1.1 Serial Peripheral Interface (SPI)

The SPI (DRV8703-Q1 only) is used to set device configurations, operating parameters, and read out diagnostic information. The DRV8703-Q1 SPI operates in slave mode. The SPI input data (SDI) word consists of a 16-bit word, with a 5-bit command, 3 don't care bits, and 8 bits of data. The SPI output data (SDO) word consists of 8-bit register data and the first 8 bits are don't cares.

A valid frame has to meet following conditions:

- The clock polarity (CPOL) must be set to 0.
- The clock phase (CPHA) must be set to 0.
- The SCLK pin must be low when the nSCS pin goes low and when the nSCS pin goes high.
- No SCLK signal can occur when the nSCS signal is in transition.
- The SCLK pin must be low when the nSCS pin goes high.
- The nSCS pin should be taken high for at least 500 ns between frames.
- When the nSCS pin is asserted high, any signals at the SCLK and SDI pins are ignored, and the SDO pin is in the high impedance state.
- Full 16 SCLK cycles must occur.
- Data is captured on the falling edge of the clock and data is driven on the rising edge of the clock.
- The most-significant bit (MSB) is shifted in and out first
- For a write command, if the data word sent to the SDI pin is less than or more than 16 bits, a frame error occurs and the data word is ignored.
- For a write command, the existing data in the register being written to is shifted out on the SDO pin following the 5-bit command data

## Programming (continued)

### 8.5.1.2 SPI Format

The SDI input-data word is 16 bits long and consists of the following format:

- 1 read or write bit, W (bit 15)
- 4 address bits, A (bits 14 through 11)
- 3 don't care bits, X (10 through 8)
- 8 data bits, D (7:0)

The SDO output-data word is 16 bits long and the first 8 bits are don't care bits. The data word is the content of the register being accessed.

For a write command ( $W0 = 0$ ), the response word on the SDO pin is the data currently in the register being written to.

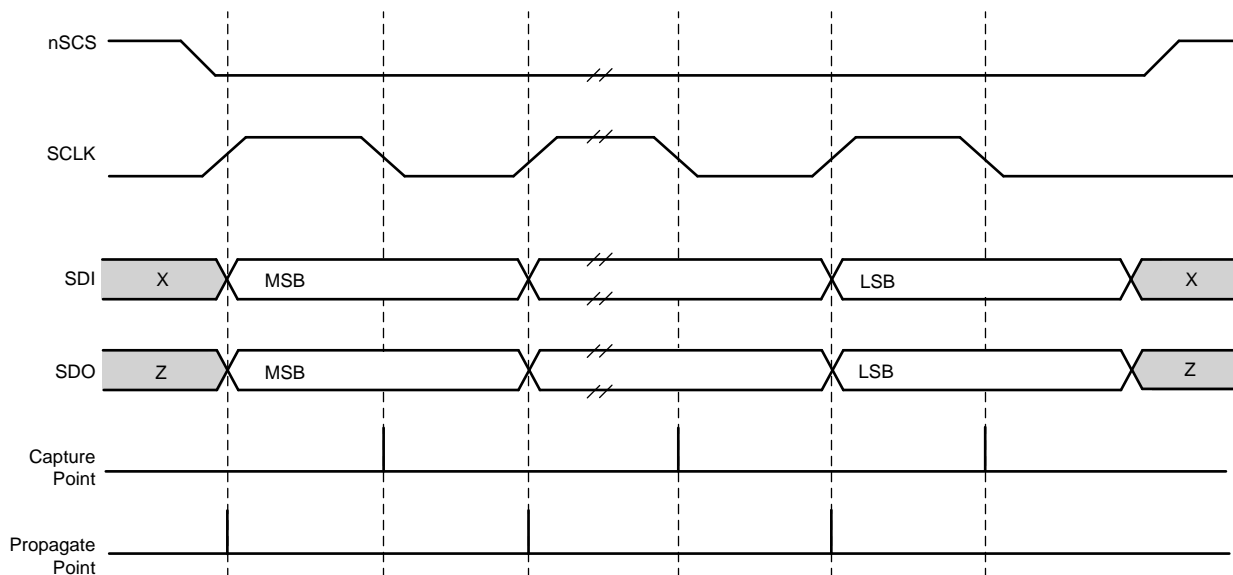

For a read command ( $W0 = 1$ ), the response word is the data currently in the register being read.

**Table 12. SDI Input Data Word Format**

R/W	ADDRESS				DON'T CARE			DATA							
B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
W0	A3	A2	A1	A0	X	X	X	D7	D6	D5	D4	D3	D2	D1	D0

**Table 13. SDO Output Data Word Format**

DON'T CARE								DATA							
B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
X	X	X	X	X	X	X	X	D7	D6	D5	D4	D3	D2	D1	D0

**Figure 46. SPI Transaction**

The SCLK pin should be low at power-up of the device for reliable SPI transaction. If the SCLK pin cannot be guaranteed to be low at power-up, TI recommends performing a dummy SPI-read transaction (of any register) after power-up to ensure reliable subsequent transactions. Data read from this dummy read transaction should be discarded.

## 8.6 Register Maps

**DRV8703-Q1 Memory Map**

Register Name	7	6	5	4	3	2	1	0	Access Type	Address (Hex)
FAULT Status	FAULT	WDFLT	GDF	OCF	VM_UVFL	VCP_UVFL	OTSD	OTW	R	0
VDS and GDF	H2_GDF	L2_GDF	H1_GDF	L1_GDF	H2_VDS	L2_VDS	H1_VDS	L1_VDS	R	1

5	CHOP_IDS	R/W	0b	Disables current regulation (enabled by default)
4-3	VREF_SCL	R/W	00b	Scale factor for the VREF input 00b = 100% 01b = 75% 10b = 50% 11b = 25%
2	SH_EN	R/W	0b	Enables sample and hold operation of the shunt amplifier (disabled by default)
1-0	GAIN_CS	R/W	01b	Shunt amplifier gain setting 00b = 10 V/V 01b = 19.8 V/V 10b = 39.4 V/V 11b = 78 V/V

## 9 Application and Implementation

## NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 9.1 Application Information

The DRV870x-Q1 device is used in brushed-DC, solenoid, or relay-control applications. The following typical application can be used to configure the DRV870x-Q1 device.

## 9.2 Typical Application

This application features the DRV8702-Q1 device.

Copyright © 2017, Texas Instruments Incorporated

### Figure 53. DRV8702-Q1 Typical Application Schematic

## Typical Application (continued)

### 9.2.1 Design Requirements

For this design example, use the parameters listed in [Table 24](#) as the input parameters.

**Table 24. Design Parameters**

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Nominal supply voltage	VM	14 V
Supply voltage range		7 V to 35 V
FET part number		CSD18502Q5B
FET total gate charge	$Q_g$	52 nC (typical)
FET gate-to-drain charge	$Q_{gd}$	8.4 nC (typical)
Target FET gate rise time	$t_r$	100 to 300 ns
Motor current chopping level	$I_{(CHOP)}$	15 A

### 9.2.2 Detailed Design Procedure

#### 9.2.2.1 External FET Selection

The DRV8702-Q1 FET support is based on the charge-pump capacity and PWM-output frequency. For a quick calculation of FET driving capacity, use [Equation 3](#) when drive and brake (slow decay) are the primary modes of operation.

$$Q_g < \frac{I_{VCP}}{f_{(PWM)}}$$

where

- $f_{PWM}$  is the maximum desired PWM frequency to be applied to the DRV8702-Q1 inputs or the current chopping frequency, whichever is larger.
- $I_{VCP}$  is the charge-pump capacity, which depends on the VM voltage.

(3)

The internal current chopping frequency is at most equal to the PWM frequency as shown in [Equation 4](#).

$$f_{(PWM)} < \frac{1}{t_{off} + t_{(BLANK)}}$$

(4)

For example, if the VM voltage of a system is 7 V ( $I_{VCP} = 8$  mA) and uses a maximum PWM frequency of 40 kHz, then the DRV8702-Q1 device will support FETs with a  $Q_g$  up to 200 nC.

If the application requires a forced fast decay (or alternating between drive and reverse drive), use [Equation 5](#) to calculate the maximum FET driving capacity.

$$Q_g < \frac{I_{VCP}}{2 \times f_{(PWM)}}$$

(5)

#### 9.2.2.2 IDRIIVE Configuration

The IDRIIVE current is selected based on the gate charge of the FETs. The IDRIIVE pin must be configured so that the FET gates are charged entirely during the  $t_{(DRIVE)}$  time. If the selected IDRIIVE current is too low for a given FET, then the FET may not turn on completely. TI recommends adjusting these values in-system with the required external FETs and motor to determine the best possible setting for any application.

For FETs with a known gate-to-drain charge ( $Q_{gd}$ ) and desired rise time ( $t_r$ ), the IDRIIVE current can be selected based on the [Equation 6](#).

$$I_{DRIVE} > \frac{Q_{gd}}{t_r}$$

(6)

If the gate-to-drain charge is 2.3 nC and the desired rise time is around 100 to 300 ns, use [Equation 7](#) to calculate the minimum IDRIVE ( $I_{DRIVE1}$ ) and [Equation 8](#) to calculate the maximum IDRIVE ( $I_{DRIVE2}$ ).

$$I_{DRIVE1} = 8.4 \text{ nC} / 100 \text{ ns} = 84 \text{ mA} \quad (7)$$

$$I_{DRIVE2} = 8.4 \text{ nC} / 300 \text{ ns} = 28 \text{ mA} \quad (8)$$

Select a value for IDRIVE between 28 and 84 mA. An IDRIVE value of approximately 50 mA for the source (approximately 100 mA sink) was selected for this application. This value requires a 200-kΩ resistor from the IDRIVE pin to ground.

### 9.2.2.3 VDS Configuration

The VDS monitor is configured based on the maximum current and  $R_{DS(on)}$  of the FETs. The VDS pin of the DRV8702-Q1 selects the VDS monitor trip threshold. Use [Equation 9](#) to calculate the trip current.

$$I_{VDS} > \frac{V_{VDS}}{R_{DS(on)}} \quad (9)$$

If the  $R_{DS(on)}$  of the FET is 1.8 mΩ and the desired VDS trip is less than 100 A, the  $V_{VDS}$  voltage is equal to 180 mV as shown in [Equation 10](#).

$$V_{VDS} = I_{VDS} \times R_{DS(on)} = 100 \text{ A} \times 1.8 \text{ m}\Omega = 180 \text{ mV} \quad (10)$$

Select a value for the VDS voltage that less than 180 mV. A  $V_{VDS}$  value of 0.12 V was selected for this application. This value requires tying the VDS pin to ground. The VDS pin can be left floating. See the [VDS Pin \(DRV8702-Q1 Only\)](#) section for more information on VDS operation.

### 9.2.2.4 Current Chopping Configuration

The chopping current is set based on the sense resistor value and the analog voltage at the VREF pin. Use [Equation 11](#) to calculate the current ( $I_{CHOP}$ ). The amplifier gain,  $A_V$ , is 19.8 V/V for the DRV8702-Q1 and  $V_{IO}$  is typically 5 mV (input referred).

$$I_{CHOP} = \frac{V_{VREF} - V_{IO} \times A_V}{A_V \times R_{(SENSE)}} \quad (11)$$

For example, if the desired chopping current is 15 A, select a value of 10 mΩ for  $R_{(SENSE)}$ . The value of  $V_{VREF}$  must therefore be 2.975 V. Add a resistor divider from the AVDD (5 V) pin to set the  $V_{VREF}$  at approximately 3.05 V. Select a value of 13 kΩ for and 20 kΩ for R1. Select a value of 13 kΩ for R2 and 19.1 kΩ for R1 (the VREF resistor).

## 9.2.3 Application Curves

## 10 Power Supply Recommendations

The DRV8702-Q1 device is designed to operate with an input voltage supply (VM) range from 5.5 V to 45 V. A 0.1- $\mu$ F ceramic capacitor rated for VM must be placed as close to the DRV8702-Q1 device as possible. Also, a bulk capacitor valued at least 10  $\mu$ F must be placed on the VM pin.

Additional bulk capacitance is required to bypass the external H-bridge FETs.

### 10.1 Bulk Capacitance Sizing

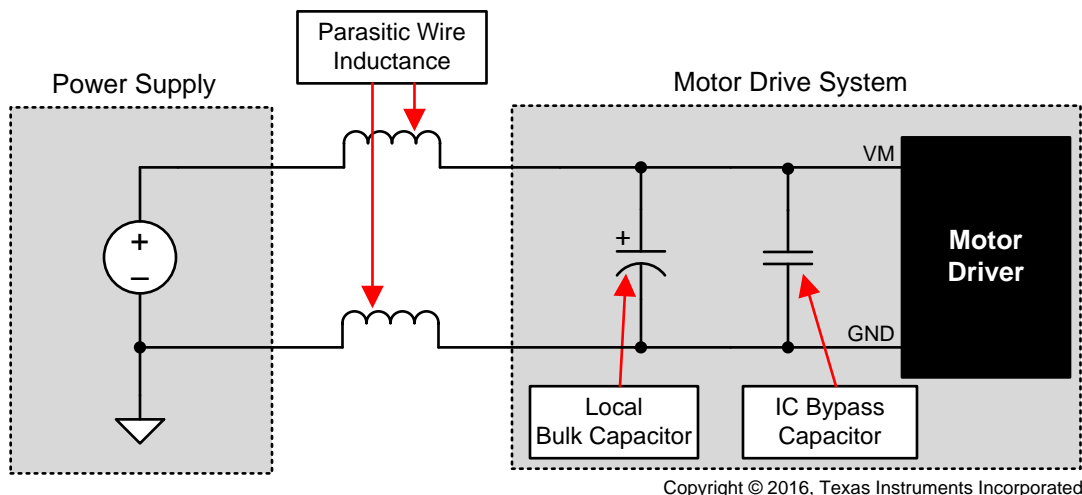

Bulk capacitance sizing is an important factor in motor drive system design. It is beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors including:

- The highest current required by the motor system.
- The capacitance of the power supply and the ability of the power supply to source current.
- The amount of parasitic inductance between the power supply and motor system.
- The acceptable voltage ripple.
- The type of motor used (brushed DC, brushless DC, and stepper).
- The motor braking method.

The inductance between the power supply and motor drive system limits the rate that current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When sufficient bulk capacitance is used, the motor voltage remains stable, and high current can be quickly supplied.

The data sheet provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

Copyright © 2016, Texas Instruments Incorporated

**Figure 59. Example Setup of Motor Drive System With External Power Supply**

The voltage rating for bulk capacitors should be higher than the operating voltage to provide a margin for cases when the motor transfers energy to the supply.

## 11 Layout

### 11.1 Layout Guidelines

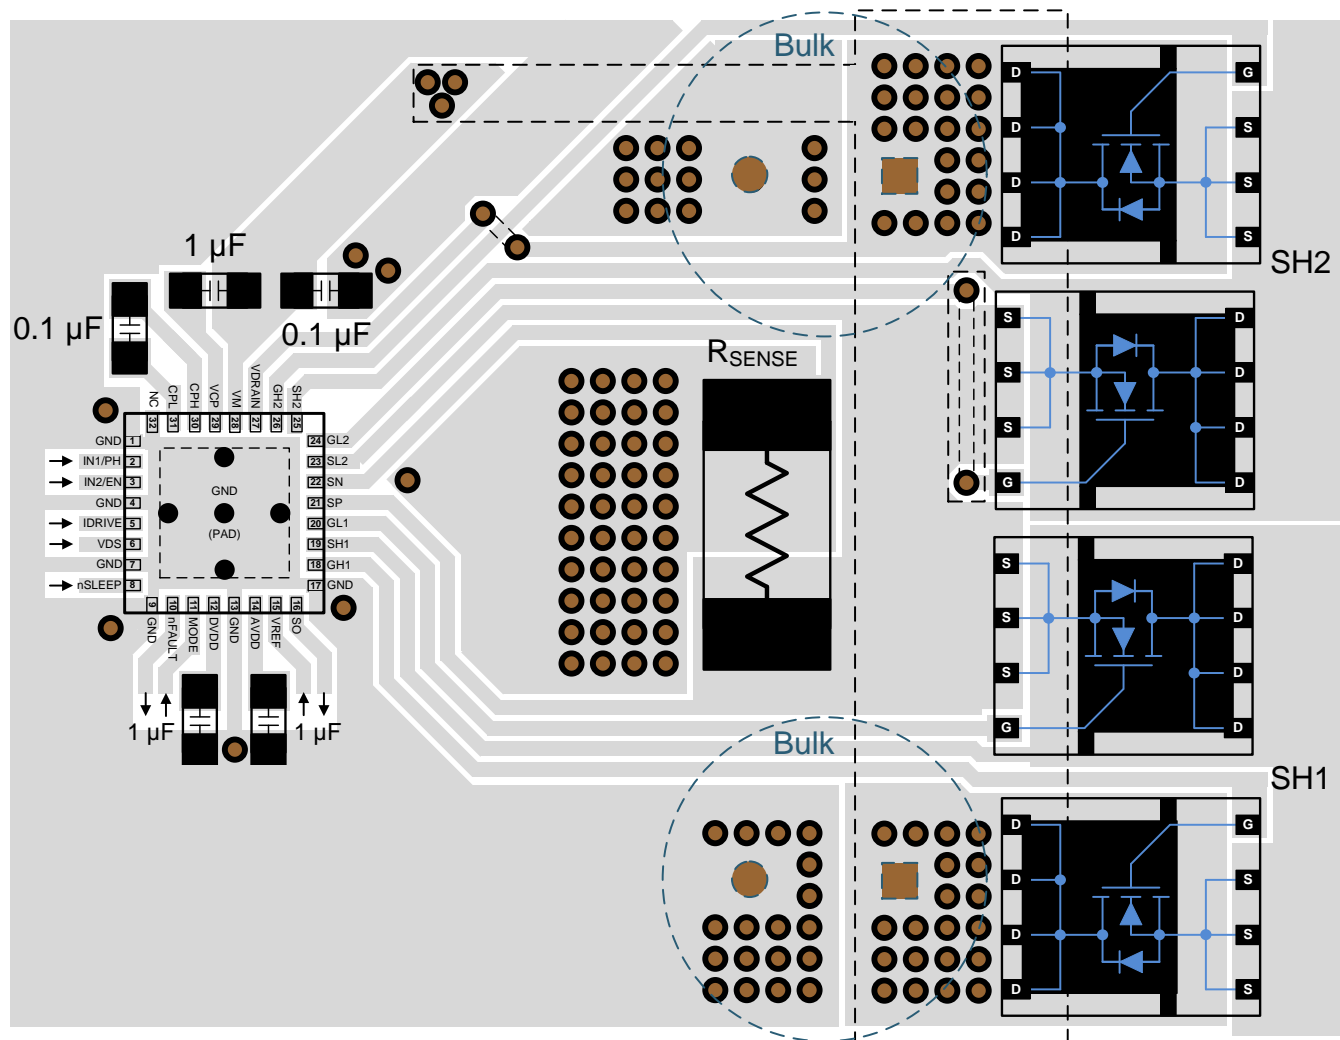

The VM pin should be bypassed to ground using a low-ESR ceramic bypass capacitor with a recommended value of 0.1  $\mu\text{F}$  rated for VM. This capacitor should be placed as close to the VM pin as possible with a thick trace or ground-plane connection to the GND pin of the device. The VM pin must also be bypassed to ground using a bulk capacitor rated for VM. This capacitor can be electrolytic and must be at least 10  $\mu\text{F}$ .

A low-ESR ceramic capacitor must be placed between the CPL and CPH pins. A value of 0.1  $\mu\text{F}$  rated for VM is recommended. Place this capacitor as close to the pins as possible. A low-ESR ceramic capacitor must be placed in between the VM and VCP pins. A value of 1  $\mu\text{F}$  rated for 16 V is recommended. Place this component as close to the pins as possible.

Bypass the AVDD and DVDD pins to ground with ceramic capacitors rated for 6.3 V. Place these bypassing capacitors as close to the pins as possible.

Use separate traces to connect the SP and SN pins to the  $R_{(\text{SENSE})}$  resistor.

### 11.2 Layout Example

**Figure 60. DRV8702-Q1 Layout Example**

### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 12.5 Trademarks

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

---

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
