

DS90CR281/DS90CR282 28-Bit Channel Link

General Description

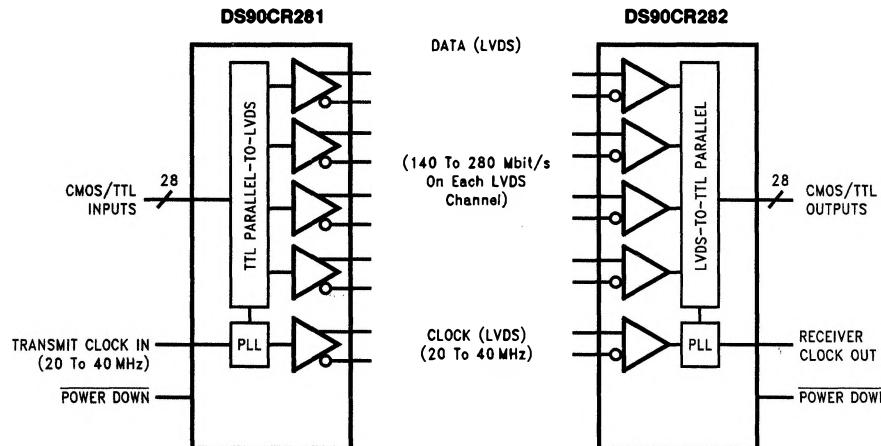

The DS90CR281 transmitter converts 28 bits of CMOS/TTL data into four LVDS (Low Voltage Differential Signaling) data streams. A phase-locked transmit clock is transmitted in parallel with the data streams over a fifth LVDS link. Every cycle of the transmit clock 28 bits of input data are sampled and transmitted. The DS90CR282 receiver converts the LVDS data streams back into 28 bits of CMOS/TTL data. At a transmit clock frequency of 40 MHz, 28 bits of TTL data are transmitted at a rate of 280 Mbps per LVDS data channel. Using a 40 MHz clock, the data throughput is 140 Megabytes per second.

The 28 CMOS/TTL inputs can support a variety of signal combinations. For example, 7 4-bit nibbles or 3 9-bit (byte + parity) and 1 control.
