LOW DROP DUAL POWER OPERATIONAL AMPLIFIERS

PRELIMINARY DATA

- OUTPUT CURRENT TO 1A
- OPERATES AT LOW VOLTAGES
- SINGLE OR SPLIT SUPPLY
- LARGE COMMON-MODE AND DIFFERENTIAL MODE RANGE
- LOW INPUT OFFSET VOLTAGE
- GROUND COMPATIBLE INPUTS
- LOW SATURATION VOLTAGE
- THERMAL SHUTDOWN
- CLAMP DIODE

The L2720, L2722 and L2724 are monolithic integrated circuits in powerdip, minidip and SIP-9 packages, intended for use as power operational amplifiers in a wide range of applications including servo amplifiers and power supplies.

They are particularly indicated for driving, inductive loads, as motor and finds applications in compact-disc VCR automotive, etc.

The high gain and high output power capability provide superior performance whatever an operational amplifier/power booster combination is required.

APPLICATION SUGGESTION

In order to avoid possible instability occurring into final stage the usual suggestions for the linear power stages are useful, as for instance:

- layout accuracy;
- A 100nF capacitor connected between supply pins and ground;
- boucherot cell (0.1 to 0.2 μF + 1Ω series) between outputs and ground or across the load. With single supply operation, a resistor (1KΩ) between the output and supply pin can be necessary for stability.

For circuit stability ensure that $R_X > \frac{2R3 \circ R1}{R_M}$ where R_M = internal resistance of motor. The voltage available at the terminals of the motor is $V_M = 2\,(V_i - \frac{V_s}{2}) + |R_o| .\ I_M$ where $|R_o| = \frac{2R \circ R1}{R_X}$ and I_M is the motor current.
