

2.5 V VOLTAGE REFERENCES

- LOW TEMPERATURE COEFFICIENT
- WIDE OPERATING CURRENT OF 400 μ A TO 10 mA
- 0.2 Ω DYNAMIC IMPEDANCE
- GUARANTEED TEMPERATURE STABILITY
- FAST TURN-ON

DESCRIPTION

The LM236 and LM336 are precision 2.5 V regulator diodes. These voltage reference monolithic ICs operate like 2.5 V zener diodes with a low temperature coefficient and a dynamic impedance of 0.2 Ω . A third pin enables adjusting the reference voltage and the temperature coefficient.

Note : 1. The maximum junction temperature of the LM236 is + 125 °C and the LM336 is + 100 °C. For elevated junction temperature, devices should be derated based on a thermal resistance of 180 °C/W junction to ambient with 10 mm leads from a PC board or 160 °C/W junction to ambient with 3 mm lead length to a PC board.

APPLICATIONS HINTS

The LM236, LM336 voltage references are easier to use than zener diodes. Their low impedance and wide current range facilitate biasing in any circuits. Besides, the breakdown voltage or the temperature coefficient can be adjusted so as to optimize the performance of the circuit.

Figure 1 represents a LM336 with a 10 k Ω potentiometer to adjust the reverse breakdown voltage. By adding resistor R1, the breakdown voltage can be adjusted without altering the temperature coefficient

of the circuit. The adjustment range is generally sufficient to adjust the initial tolerance of the circuit and the inaccuracy of the amplifier circuit.

To obtain a lower temperature coefficient two diodes can be connected in series as indicated in fig. 2. When the circuit is adjusted to 2.49 V the temperature coefficient is minimized.

For a correct temperature coefficient, the diodes should be at the same ambient temperature as the LM336. The value of R1 is not critical (2-20 k Ω).
