

## LM2940/LM2940C 1A Low Dropout Regulator

### General Description

The LM2940/LM2940C positive voltage regulator features the ability to source 1A of output current with a dropout voltage of typically 0.5V and a maximum of 1V over the entire temperature range. Furthermore, a quiescent current reduction circuit has been included which reduces the ground current when the differential between the input voltage and the output voltage exceeds approximately 3V. The quiescent current with 1A of output current and an input-output differential of 5V is therefore only 30 mA. Higher quiescent currents only exist when the regulator is in the dropout mode ( $V_{IN} - V_{OUT} \leq 3V$ ).

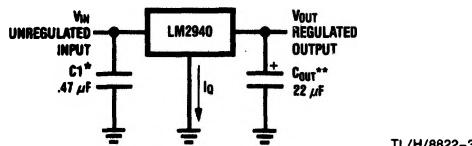

Designed also for vehicular applications, the LM2940/LM2940C and all regulated circuitry are protected from reverse battery installations or 2-battery jumps. During line transients, such as load dump when the input voltage can momentarily exceed the specified maximum operating volt-

age, the regulator will automatically shut down to protect both the internal circuits and the load. The LM2940/LM2940C cannot be harmed by temporary mirror-image insertion. Familiar regulator features such as short circuit and thermal overload protection are also provided.

### Features

- Dropout voltage typically 0.5V @ $I_O = 1A$
- Output current in excess of 1A
- Output voltage trimmed before assembly
- Reverse battery protection
- Internal short circuit current limit
- Mirror image insertion protection
- P+ Product Enhancement tested

### Typical Application

TL/H/8822-3

\*Required if regulator is located far from power supply filter.

\*\* $C_{OUT}$  must be at least 22  $\mu F$  to maintain stability. May be increased without bound to maintain regulation during transients. Locate as close as possible to the regulator. This capacitor must be rated over the same operating temperature range as the regulator and the ESR is critical; see curve.

### Ordering Information

**Note 1:** Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Conditions are conditions under which the device functions but the specifications might not be guaranteed. For guaranteed specifications and test conditions see the Electrical Characteristics.

**Note 2:** Military specifications complied with RETS/SMD at the time of printing. For current specifications refer to RETS LM2940K-5.0, LM2940K-8.0, LM2940K-12, and LM2940K-15. SMD numbers are 5962-8958701YA(5V), 5962-9088301YA(8V), 5962-9088401YA(12V), and 5962-9088501YA(15V).

**Note 3:** The maximum power dissipation is a function of the maximum junction temperature,  $T_J = 150^\circ\text{C}$ , the junction-to-ambient thermal resistance,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_{D\text{MAX}} = (150 - T_A)/\theta_{JA}$ . If this dissipation is exceeded, the die temperature will rise above  $150^\circ\text{C}$  and the LM2940 will go into thermal shutdown. For the LM2940T and LM2940CT, the junction-to-ambient thermal resistance ( $\theta_{JA}$ ) is  $53^\circ\text{C}/\text{W}$ . When using a heatsink,  $\theta_{JA}$  is the sum of the  $3^\circ\text{C}/\text{W}$  junction-to-case thermal resistance ( $\theta_{JC}$ ) of the LM2940T or LM2940CT and the case-to-ambient thermal resistance of the heatsink. If the TO-263 package is used, the thermal resistance can be used by increasing the P.C. board copper area thermally connected to the package. Using 0.5 square inches of copper area,  $\theta_{JA}$  is  $50^\circ\text{C}/\text{W}$ ; with 1 square inch of copper area,  $\theta_{JA}$  is  $37^\circ\text{C}/\text{W}$ ; and with 1.6 or more square inches of copper area,  $\theta_{JA}$  is  $32^\circ\text{C}/\text{W}$ . For the LM2940K,  $\theta_{JA}$  is  $39^\circ\text{C}/\text{W}$  and  $\theta_{JC}$  is  $4^\circ\text{C}/\text{W}$ .

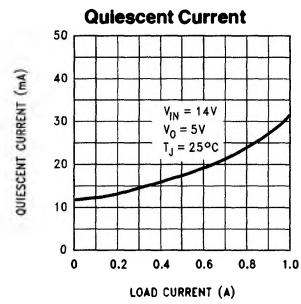

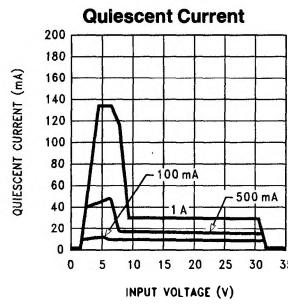

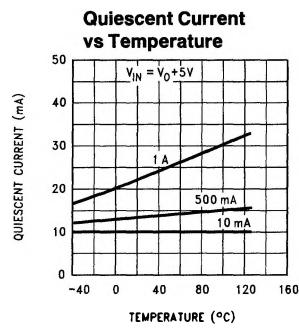

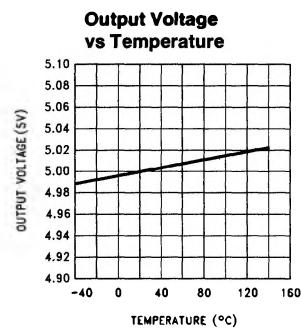

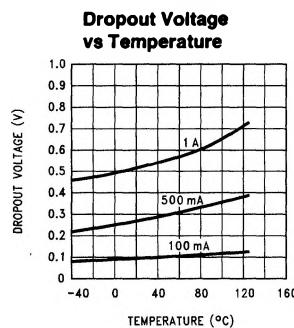

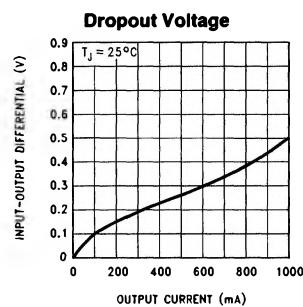

**Note 4:** ESD rating is based on the human body model, 100 pF discharged through 1.5 kΩ.

**Note 5:** All limits are guaranteed at  $T_A = T_J = 25^\circ\text{C}$  only (standard typeface) or over the entire operating temperature range of the indicated device (boldface type). All limits at  $T_A = T_J = 25^\circ\text{C}$  are 100% production tested. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control methods.

**Note 6:** All limits are guaranteed at  $T_A = T_J = 25^\circ\text{C}$  only (standard typeface) or over the entire operating temperature range of the indicated device (boldface type). All limits are 100% production tested and are used to calculate Outgoing Quality Levels.

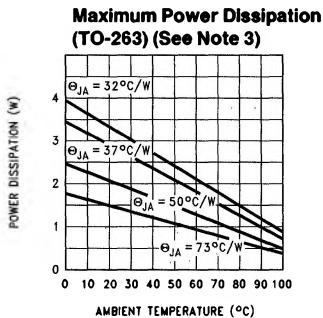

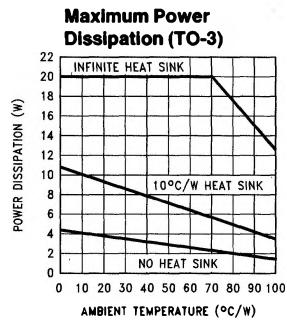

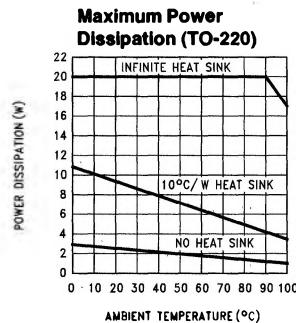

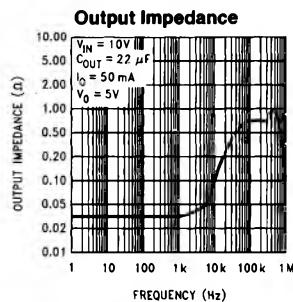

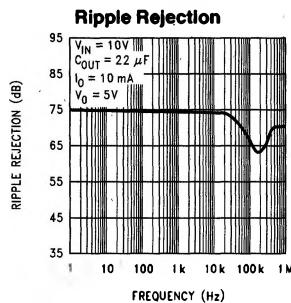

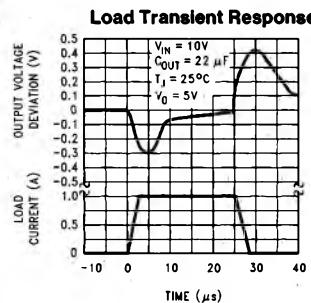

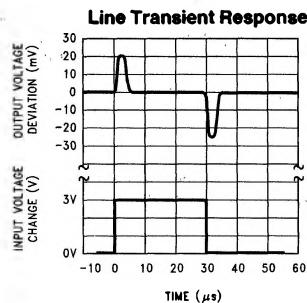

**Note 7:** Output current will decrease with increasing temperature but will not drop below 1A at the maximum specified temperature.
