National Semiconductor

LM105/LM205/LM305/LM305A, LM376 Voltage Regulators

General Description

The LM105 series are positive voltage regulators similar to the LM100, except that an extra gain stage has been added for improved regulation. A redesign of the biasing circuitry removes any minimum load current requirement and at the same time reduces standby current drain, permitting higher voltage operation. They are direct, plug-in replacements for the LM100 in both linear and switching regulator circuits with output voltages greater than 4.5V. Important characteristics of the circuits are:

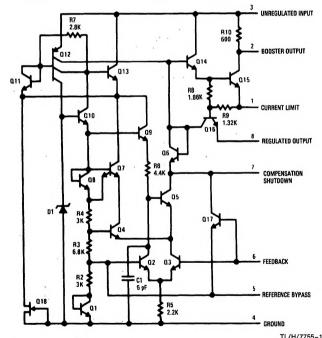

- Output voltage adjustable from 4.5V to 40V
- Output currents in excess of 10A possible by adding external transistors
- Load regulation better than 0.1%, full load with current limiting

- DC line regulation guaranteed at 0.03%/V
- Ripple rejection on 0.01%V
- 45 mA output current without external pass transistor (LM305A)

Like the LM100, they also feature fast response to both load and line transients, freedom from oscillations with varying resistive and reactive loads and the ability to start reliably on any load within rating. The circuits are built on a single silicon chip and are supplied in either an 8-lead, TO-5 header or a $1/4^{\circ}$ x $1/4^{\circ}$ metal flat package.

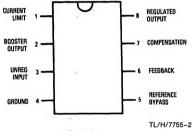

The LM105 is specified for operation for $-55^{\circ}C \le T_A \le +125^{\circ}C$, the LM205 is specified for $-25^{\circ}C \le T_A \le +85^{\circ}C$, and the LM305/LM305A, LM376 is specified for $0^{\circ}C \le T_A \le +70^{\circ}C$.

Schematic and Connection Diagrams

Pin connections shown are for metal can.

Note 1: The maximum junction temperature of the LM105 and LM305A is 150°C, the LM205 and LM305 is 85°C. For operation at elevated temperatures, devices in the H08C package must be derated based on a thermal resistance of 138°C/W junction to ambient. Peak dissipations to 1W are on a thermal resistance of 168°C/W junction to ambient. Peak dissipations to 1W are allowable providing the dissipation rating is not exceeded with the power average over a five second interval for the LM105 and LM205, and averaged over a two second interval for the LM305.

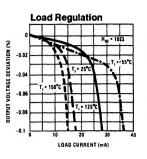

Note 2: Unless otherwise specifications apply for temperatures within the operating temperature range, for input and output voltages within the range given, and for a divider impedance seen by the feedback terminal Note 3: The output currents given, as well as the load regulation, can be increased by the addition of external transistors. The improvement factor will be roughly equal to the composite current gain of the added transistors. of 2 kn. Load and line regulation specifications are for a constant junction temperature. Temperature drift effects must be taken into account separately when the unit is operating under conditions of high dissipation.

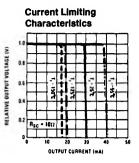

Note 4: With no external pass transistor.

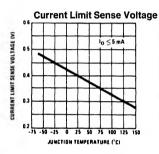

Note 5: Refer to RETS105X Drawing for military specifications for the LM105.

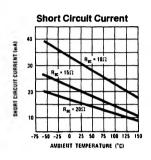

Typical Performance Characteristics LM105/LM205/LM305/LM305A
