

## LM4610 Dual DC Operated Tone/Volume/Balance Circuit with National 3-D Sound

**Check for Samples:** [LM4610](#)

## FEATURES

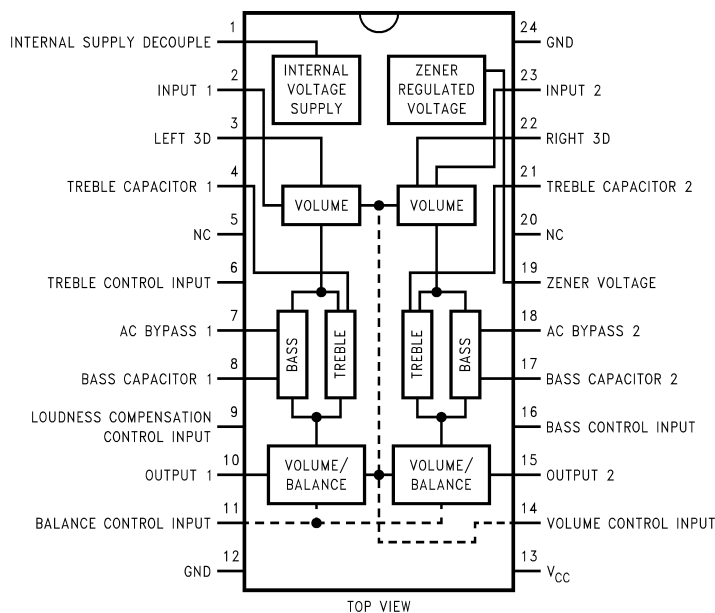

- ## FEATURES
- National 3-D Sound
  - Wide supply voltage range, 9V to 16V
  - Large volume control range, 75 dB typical
  - Tone control,  $\pm 15$  dB typical
  - Channel separation, 75 dB typical
  - Low distortion, 0.06% typical for an input level of 0.3 Vrms
  - High signal to noise, 80 dB typical for an input level of 0.3 Vrms
  - Few external components required

## DESCRIPTION

The LM4610 is a DC controlled tone (bass/treble), volume and balance circuit for stereo applications in car radio, TV and audio systems. It also features National's 3D-Sound Circuitry which can be externally adjusted via a simple RC Network. An additional control input allows loudness compensation to be simply effected.

Four control inputs provide control of the bass, treble, balance and volume functions through application of DC voltages from a remote control system or, alternatively, from four potentiometers which may be biased from a zener regulated supply provided on the circuit.

Each tone response is defined by a single capacitor chosen to give the desired characteristic.

A. Order Number LM4610N. See NS Package Number N24A.

### Figure 1. Dual-In-Line Package

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

**Absolute Maximum Ratings** <sup>(1)</sup>

Supply Voltage	16V
Control Pin Voltage (Pins 6, 9, 11, 14, 16)	V <sub>CC</sub>
Operating Temperature Range	0°C to +70°C
Storage Temperature Range	–65°C to +150°C
Power Dissipation	1.5W
Lead Temp. (Soldering, 10 seconds)	260°C

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits.

## Electrical Characteristics

 $V_{CC}=12V$ ,  $T_A=25^{\circ}C$  (unless otherwise stated)

Parameter	Conditions	Min	Typ	Max	Units
Supply Voltage Range	Pin 13	9		16	V
Supply Current			35	45	mA
Zener Regulated Output	Pin 19				
Voltage			5.4		V
Current				5	mA
Maximum Output Voltage	Pins 10, 15; $f=1$ kHz				
	$V_{CC}=9V$ , Maximum Gain		0.8		Vrms
	$V_{CC}=12V$	0.8	1.0		Vrms
Maximum Input Voltage	Pins 2, 23; $f=1$ kHz, $V_{CC}=9V$	1.3	1.1		Vrms
(1)	Flat Gain Response, $V_{CC}=12V$		1.6		Vrms
	Gain=-10 dB				
Input Resistance	Pins 2, 23; $f=1$ kHz	20	30		k $\Omega$
Output Resistance	Pins 10, 15; $f=1$ kHz		20		$\Omega$
Maximum Gain	$V(\text{Pin } 14)=V(\text{Pin } 19)$ ; $f=1$ kHz	-2	0	2	dB
Volume Control Range	$f=1$ kHz	70	75		dB
Gain Tracking	$f=1$ kHz				
Channel 1–Channel 2	0 dB through -40 dB		1	3	dB
	-40 dB through -60 dB		2		dB
Balance Control Range	Pins 10, 15; $f=1$ kHz		1		dB
			-26	-20	dB
Bass Control Range	$f=40$ Hz, $C_b=0.39$ $\mu F$				
(2)	$V(\text{Pin } 10)=V(\text{Pin } 19)$	12	15	18	dB
	$V(\text{Pin } 10)=0V$	-12	-15	-18	dB
Treble Control Range	$f=16$ kHz, $C_t=0.01$ $\mu F$				
(2)	$V(\text{Pin } 6)=V(\text{Pin } 19)$	12	15	18	dB
	$V(\text{Pin } 6)=0V$	-12	-15	-18	dB
Total Harmonic Distortion	$f=1$ kHz, $V_{IN}=0.3$ Vrms				
	Gain=0 dB		0.06	0.3	%
	Gain=-30 dB		0.03		%
Channel Separation	$f=1$ kHz, Maximum Gain	60	75		dB
Signal/Noise Ratio	Unweighted 100 Hz–20 kHz		80		dB
	Maximum Gain, 0 dB=0.3 Vrms				
	CCIR/ARM (3)				
	Gain=0 dB, $V_{IN}=0.3$ Vrms	75	79		dB
	Gain=-20 dB, $V_{IN}=1.0$ Vrms		72		dB
Output Noise Voltage at	CCIR/ARM (3)		10		$\mu V$
Minimum Gain					
Supply Ripple Rejection	200 mVrms, 1 kHz Ripple	35	-50		dB
Control Input Currents	Pins 6, 9, 11, 14, 16( $V=0V$ )		-0.6	-2.5	$\mu A$
Frequency Response	-1 dB (Flat Response)		250		kHz
	20 Hz–16 kHz)				

(1) The maximum permissible input level is dependent on tone and volume settings. See Application Notes.

(2) The tone control range is defined by capacitors  $C_b$  and  $C_t$ . See Application Notes.

(3) Gaussian noise, measured over a period of 50 ms per channel, with a CCIR filter referenced to 2 kHz and an average-responding meter.

## Application Notes

### TONE RESPONSE

The maximum boost and cut can be optimized for individual applications by selection of the appropriate values of  $C_t$  (treble) and  $C_b$  (bass).

The tone responses are defined by the relationships:

$$\text{Bass Response} = \frac{1 + \frac{0.00065(1 - a_b)}{j\omega C_b}}{1 + \frac{0.00065a_b}{j\omega C_b}}$$

$$\text{Treble Response} = \frac{1 + j\omega 5500(1 - a_t)C_t}{1 + j\omega 5500a_tC_t}$$

(1)

Where  $a_b = a_t = 0$  for maximum bass and treble boost respectively and  $a_b = a_t = 1$  for maximum cut.

For the values of  $C_b$  and  $C_t$  of  $0.39 \mu\text{F}$  and  $0.01 \mu\text{F}$  as shown in the Application Circuit, 15 dB of boost or cut is obtained at 40 Hz and 16 kHz.

### NATIONAL 3D-SOUND

When stereo speakers need to be closer than optimum because of equipment /cabinet limitations, an improved stereo effect can be obtained using a modest amount of phase - reversed interchannel cross-coupling. In the LM4610 the input stage transistor emitters are brought out to facilitate this. The arrangement is shown below in the basic form.

With a monophonic source, the emitters have the same signal and the resistor and capacitor connected between them have no effect. With a stereo signal each transistor works in the grounded base mode for stereo components, generating an in-phase signal from the opposite channel. As the normal signals are inverted at this point, the appropriate phase-reversed cross-coupling is achieved. An effective level of coupling of 60% can be obtained using 4.7k in conjunction with the internal 6.5k emitter resistors. At low frequencies, speakers become less directional and it becomes desirable to reduce the enhancement effect. With a  $0.1 \mu\text{F}$  coupling capacitor, as shown, roll-off occurs below 330 Hz. The coupling components may be varied for alternative responses.

## ZENER VOLTAGE

A zener voltage (pin 19=5.4V) is provided which may be used to bias the control potentiometers. Setting a DC level of one half of the zener voltage on the control inputs, pins 6,11, and 16, results in the balanced gain and flat response condition. Typical spread on the zener voltage is  $\pm 100$  mV and this must be taken into account if control signals are used which are not referenced to the zener voltage. If this is the case, then they will need to be derived with similar accuracy.

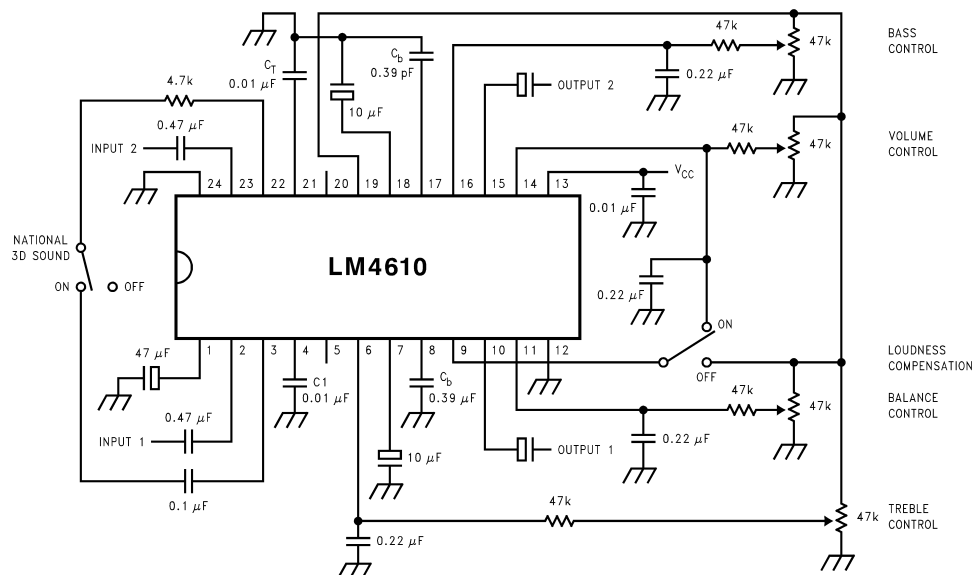

## LOUDNESS COMPENSATION

A simple loudness compensation may be effected by applying a DC control voltage to pin 9. This operates on the tone control stages to produce an additional boost limited by the maximum boost defined by  $C_b$  and  $C_t$ . There is no loudness compensation when pin 9 is connected to pin 19. Pin 9 can be connected to pin 14 to give the loudness compensated volume characteristic as illustrated without the addition of further external components. (Tone settings are for flat response,  $C_b$  and  $C_t$  as given in Application Circuit.) Modification to the loudness characteristic is possible by changing the capacitors  $C_b$  and  $C_t$  for a different basic response or, by a resistor network between pins 9 and 14 for a different threshold and slope.

## SIGNAL HANDLING

The volume control function of the LM4610 is carried out in two stages, controlled by the DC voltage on pin 14, to improve signal handling capability and provide a reduction of output noise level at reduced gain. The first stage is before the tone control processing and provides an initial 15 dB of gain reduction, so ensuring that the tone sections are not overdriven by large input levels when operating with a low volume setting. Any combination of tone and volume settings may be used provided the output level does not exceed 1 Vrms,  $V_{CC}=12V$  (0.7 Vrms,  $V_{CC}=9V$ ). At reduced gain ( $<-6$  dB) the input stage will overload if the input level exceeds 1.6 Vrms,  $V_{CC}=12V$  (1.1 Vrms,  $V_{CC}=9V$ ). As there is volume control on the input stages, the inputs may be operated with a lower overload margin than would otherwise be acceptable, allowing a possible improvement in signal to noise ratio.

## Application Circuit

## Applications Information

## OBTAINING MODIFIED RESPONSE CURVES

The LM4610 is a dual DC controlled bass, treble, balance and volume integrated circuit ideal for stereo audio systems.

In the various applications where the LM4610 can be used, there may be requirements for responses different to those of the standard application circuit given in the data sheet. This application section details some of the simple variations possible on the standard responses, to assist the choice of optimum characteristics for particular applications.

## TONE CONTROLS

Summarizing the relationship given in the data sheet, basically for an increase in the treble control range  $C_t$  must be increased, and for increased bass range  $C_b$  must be reduced.

Figure 3 shows the typical tone response obtained in the standard application circuit. ( $C_t=0.01\ \mu\text{F}$ ,  $C_b=0.39\ \mu\text{F}$ ). Response curves are given for various amounts of boost and cut.

**Figure 3. Tone Characteristic (Gain vs Frequency)**

Figure 4 and Figure 5 show the effect of changing the response defining capacitors  $C_t$  and  $C_b$  to  $2C_t$ ,  $C_b/2$  and  $4C_t$ ,  $C_b/4$  respectively, giving increased tone control ranges. The values of the bypass capacitors may become significant and affect the lower frequencies in the bass response curves.

**Figure 4. Tone Characteristic (Gain vs Frequency)**

**Figure 5. Tone Characteristic (Gain vs Frequency)**

Figure 6 shows the effect of changing  $C_t$  and  $C_b$  in the opposite direction to  $C_t/2$ ,  $2C_b$  respectively giving reduced control ranges. The various results corresponding to the different  $C_t$  and  $C_b$  values may be mixed if it is required to give a particular emphasis to, for example, the bass control. The particular case with  $C_b/2$ ,  $C_t$  is illustrated in Figure 7.

## RESTRICTION OF TONE CONTROL ACTION AT HIGH OR LOW FREQUENCIES

It may be desired in some applications to level off the tone responses above or below certain frequencies for example to reduce high frequency noise.

This may be achieved for the treble response by including a resistor in series with  $C_t$ . The treble boost and cut will be 3 dB less than the standard circuit when  $R=X_C$ .

A similar effect may be obtained for the bass response by reducing the value of the AC bypass capacitors on pins 7 (channel 1) and 18 (channel 2). The internal resistance at these pins is 1.3 k $\Omega$  and the bass boost/cut will be approximately 3 dB less with  $X_C$  at this value. An example of such modified response curves is shown in Figure 8. The input coupling capacitors may also modify the low frequency response.

It will be seen from Figure 4 and Figure 5 that modifying  $C_t$  and  $C_b$  for greater control range also has the effect of flattening the tone control extremes and this may be utilized, with or without additional modification as outlined above, for the most suitable tone control range and response shape.

## OTHER ADVANTAGES OF DC CONTROLS

The DC controls make the addition of other features easy to arrange. For example, the negative-going peaks of the output amplifiers may be detected below a certain level, and used to bias back the bass control from a high boost condition, to prevent overloading the speaker with low frequency components.

## LOUDNESS CONTROL

The loudness control is achieved through control of the tone sections by the voltage applied to pin 9; therefore, the tone and loudness functions are not independent. There is normally 1 dB more bass than treble boost (40 Hz–16 kHz) with loudness control in the standard circuit. If a greater difference is desired, it is necessary to introduce an offset by means of  $C_t$  or  $C_b$  or by changing the nominal control voltage ranges.

Figure 9 shows the typical loudness curves obtained in the standard application circuit at various volume levels ( $C_b=0.39 \mu\text{F}$ ).

Figure 6. Tone Characteristic (Gain vs Frequency)

Figure 7. Tone Characteristic (Gain vs Frequency)

Figure 8. Tone Characteristic (Gain vs Frequency)

Figure 9. Loudness Compensated Volume Characteristic

Figure 10 and Figure 11 illustrate the loudness characteristics obtained with  $C_b$  changed to  $C_b/2$  and  $C_b/4$  respectively,  $C_t$  being kept at the nominal  $0.01 \mu\text{F}$ . These values naturally modify the bass tone response as in Figure 4 and Figure 5.

With pins 9 (loudness) and 14 (volume) directly connected, loudness control starts at typically  $-8 \text{ dB}$  volume, with most of the control action complete by  $-30 \text{ dB}$ .

Figure 10. Loudness Compensated Volume Characteristic

Figure 11. Loudness Compensated Volume Characteristic

Figure 12 and Figure 13 show the effect of resistively offsetting the voltage applied to pin 9 towards the control reference voltage (pin 19). Because the control inputs are high impedance, this is easily done and high value resistors may be used for minimal additional loading. It is possible to reduce the rate of onset of control to extend the active range to  $-50$  dB volume control and below.

The control on pin 9 may also be divided down towards ground bringing the control action on earlier. This is illustrated in Figure 14, With a suitable level shifting network between pins 14 and 9, the onset of loudness control and its rate of change may be readily modified.

Figure 12. Loudness Compensated Volume Characteristic

Figure 13. Loudness Compensated Volume Characteristic

Figure 14. Loudness Compensated Volume Characteristic

When adjusted for maximum boost in the usual application circuit, the LM4610 cannot give additional boost from the loudness control with reducing gain. If it is required, some additional boost can be obtained by restricting the tone control range and modifying  $C_t$ ,  $C_b$ , to compensate. A circuit illustrating this for the case of bass boost is shown in Figure 16. The resulting responses are given in Figure 16 showing the continuing loudness control action possible with bass boost previously applied.

#### USE OF THE LM4610 ABOVE AUDIO FREQUENCIES

The LM4610 has a basic response typically 1 dB down at 250 kHz (tone controls flat) and therefore by scaling  $C_b$  and  $C_t$ , it is possible to arrange for operation over a wide frequency range for possible use in wide band equalization applications. As an example Figure 17 shows the responses obtained centered on 10 kHz with  $C_b=0.039$   $\mu$ F and  $C_t=0.001$   $\mu$ F.

**Figure 15. Modified Application Circuit for Additional Bass Boost with Loudness Control**

**Figure 16. Loudness Compensated Volume Characteristic**

**Figure 17. Tone Characteristic (Gain vs Frequency)**

## DC CONTROL OF NATIONAL 3D-SOUND AND LOUDNESS CONTROL

Figure [Figure 18](#) shows a possible circuit if electronic control of these functions is required. The typical DC level at pins 3 and 22 is 7.5V ( $V_{CC}=12$ ), with the input signal superimposed, and this can be used to bias a FET switch as shown to save components. For switching with a 0V - 5V signal a low-threshold FET is required when using a 12V supply. With larger switching levels this is less critical.

The high impedance PNP base input of the loudness control pin 9 is readily switched with a general purpose NPN transistor.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
