

## LM4843 Boomer® Audio Power Amplifier Series Stereo 2W Audio Power Amplifiers with DC Volume Control

Check for Samples: [LM4843](#)**FEATURES**

- Acoustically Enhanced DC Volume Control Taper
- Stereo bridged power amplifiers
- “Click and pop” suppression circuitry
- Thermal shutdown protection circuitry

**APPLICATIONS**

- Portable and Desktop Computers
- Multimedia Monitors
- Portable Radios, PDAs, and Portable TVs

**DESCRIPTION**

The LM4843 is a monolithic integrated circuit that provides DC volume control, and stereo bridged audio power amplifiers capable of producing 2W into 4Ω with less than 1.0% THD or 2.2W into 3Ω with less than 1.0% THD (see Notes below).

Boomer® audio integrated circuits were designed specifically to provide high quality audio while requiring a minimum amount of external components. The LM4843 incorporates a DC volume control with stereo bridged audio power amplifiers making it optimally suited for multimedia monitors, portable radios, desktop, and portable computer applications.

The LM4843 features an externally controlled, low-power consumption shutdown mode, and both a power amplifier and headphone mute for maximum system flexibility and performance.

**NOTE**

When properly mounted to the circuit board, the LM4843MH will deliver 2W into 4Ω. See the Application Information section for LM4843MH usage information.

**NOTE**

LM4843MH that has been properly mounted to the circuit board and forced-air cooled will deliver 2.2W into 3Ω.

**Table 1. Key Specifications**

	VALUE	UNIT
P <sub>O</sub> at 1% THD+N		
into 3Ω	2.2	W (typ)
into 4Ω	2.0	W (typ)
into 8Ω	1.1	W (typ)
Shutdown current	0.7	μA (typ)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## Connection Diagram

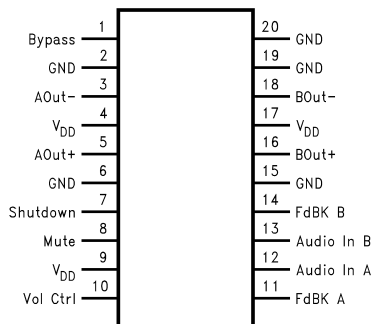

Figure 2. Standard LM4843MH (Top View)

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## Absolute Maximum Ratings <sup>(1)(2)</sup>

Supply Voltage	6.0V
Storage Temperature	-65°C to +150°C
Input Voltage	-0.3V to V <sub>DD</sub> +0.3V
Power Dissipation	Internally limited
ESD Susceptibility <sup>(3)</sup>	2000V
ESD Susceptibility <sup>(4)</sup>	200V
Junction Temperature	150°C
Soldering Information Small Outline Package Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C
See AN-450 "Surface Mounting and their Effects on Product Reliability" for other methods of soldering surface mount devices.	
$\theta_{JC}$ (typ)—MXA20A	2°C/W
$\theta_{JA}$ (typ)—MXA20A (exposed DAP) <sup>(5)</sup>	41°C/W
$\theta_{JA}$ (typ)—MXA20A (exposed DAP) <sup>(6)</sup>	54°C/W
$\theta_{JA}$ (typ)—MXA20A (exposed DAP) <sup>(7)</sup>	59°C/W
$\theta_{JA}$ (typ)—MXA20A (exposed DAP) <sup>(8)</sup>	93°C/W

- (1) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not guarantee specific performance limits. *Electrical Characteristics* state DC and AC electrical specifications under particular test conditions which guarantee specific performance limits. This assumes that the device is within the Operating Ratings. Marshall Chiu feels there are better ways to obtain "More Wattage in the Cottage." Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (2) The maximum power dissipation must be derated at elevated temperatures and is dictated by T<sub>JMAX</sub>,  $\theta_{JA}$ , and the ambient temperature T<sub>A</sub>. The maximum allowable power dissipation is P<sub>DMAX</sub> = (T<sub>JMAX</sub> - T<sub>A</sub>) /  $\theta_{JA}$ . For the LM4843MH, T<sub>JMAX</sub> = 150°C, and the typical junction-to-ambient thermal resistance, when board mounted, is 80°C/W for the MHC20 package.
- (3) Human body model, 100 pF discharged through a 1.5 k $\Omega$  resistor.
- (4) Machine Model, 220 pF–240 pF discharged through all pins.
- (5) The  $\theta_{JA}$  given is for an MXA20A package whose exposed-DAP is soldered to a 2in<sup>2</sup> piece of 1 ounce printed circuit board copper on a bottom side layer through 21 8mil vias.
- (6) The  $\theta_{JA}$  given is for an MXA20A package whose exposed-DAP is soldered to an exposed 2in<sup>2</sup> piece of 1 ounce printed circuit board copper.
- (7) The  $\theta_{JA}$  given is for an MXA20A package whose exposed-DAP is soldered to an exposed 1in<sup>2</sup> piece of 1 ounce printed circuit board copper.
- (8) The  $\theta_{JA}$  given is for an MXA20A package whose exposed-DAP is not soldered to any copper.

## Operating Ratings

Temperature Range T <sub>MIN</sub> ≤ T <sub>A</sub> ≤ T <sub>MAX</sub>	-40°C ≤ T <sub>A</sub> ≤ 85°C
Supply Voltage	2.7V ≤ V <sub>DD</sub> ≤ 5.5V

## Electrical Characteristics for Entire IC

(1)(2)

The following specifications apply for  $V_{DD} = 5V$  unless otherwise noted. Limits apply for  $T_A = 25^\circ C$ .

Symbol	Parameter	Conditions	LM4843		Units (Limits)
			Typical (3)	Limit (4)	
$V_{DD}$	Supply Voltage			2.7	V (min)
				5.5	V (max)
$I_{DD}$	Quiescent Power Supply Current	$V_{IN} = 0V, I_O = 0A$	15	30	mA (max)
$I_{SD}$	Shutdown Current	$V_{shutdown} = V_{DD}$	0.7	2.0	$\mu A$ (max)

- (1) All voltages are measured with respect to the ground pins, unless otherwise specified. All specifications are tested using the typical application as shown in [Figure 1](#).
- (2) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not guarantee specific performance limits. *Electrical Characteristics* state DC and AC electrical specifications under particular test conditions which guarantee specific performance limits. This assumes that the device is within the Operating Ratings. Marshall Chiu feels there are better ways to obtain "More Wattage in the Cottage." Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) Typicals are measured at  $25^\circ C$  and represent the parametric norm.
- (4) Limits are guaranteed to National's AOQL (Average Outgoing Quality Level). Datasheet min/max specification limits are guaranteed by design, test, or statistical analysis.

## Electrical Characteristics for Volume Attenuators

(1)(2)

The following specifications apply for  $V_{DD} = 5V$ . Limits apply for  $T_A = 25^\circ C$ .

Symbol	Parameter	Conditions	LM4843		Units (Limits)
			Typical (3)	Limit (4)	
$C_{RANGE}$	Attenuator Range <sup>(5)</sup>	Attenuation with $V_{DCVol} = 5V$ , No Load		$\pm 0.75$	dB (max)
		Attenuation with $V_{DCVol} = 0V$		-75	dB (min)
$A_M$	Mute Attenuation	$V_{mute} = 5V$ , Bridged Mode (BM)		-78	dB (min)

- (1) All voltages are measured with respect to the ground pins, unless otherwise specified. All specifications are tested using the typical application as shown in [Figure 1](#).
- (2) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not guarantee specific performance limits. *Electrical Characteristics* state DC and AC electrical specifications under particular test conditions which guarantee specific performance limits. This assumes that the device is within the Operating Ratings. Marshall Chiu feels there are better ways to obtain "More Wattage in the Cottage." Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) Typicals are measured at  $25^\circ C$  and represent the parametric norm.
- (4) Limits are guaranteed to National's AOQL (Average Outgoing Quality Level). Datasheet min/max specification limits are guaranteed by design, test, or statistical analysis.
- (5) Refers only to the internal Volume Attenuation steps. Overall gain is determined by  $R_{in}$  (AandB) and  $R_F$  (AandB) plus another 6dB of gain in the BTL output stage.

## Electrical Characteristics for Bridged Mode Operation

(1)(2)

The following specifications apply for  $V_{DD} = 5V$ , unless otherwise noted. Limits apply for  $T_A = 25^\circ C$ .

Symbol	Parameter	Conditions	LM4843		Units (Limits)
			Typical (3)	Limit (4)	
$V_{OS}$	Output Offset Voltage	$V_{IN} = 0V$ , No Load	10	$\pm 50$	mV (max)

- (1) All voltages are measured with respect to the ground pins, unless otherwise specified. All specifications are tested using the typical application as shown in [Figure 1](#).
- (2) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not guarantee specific performance limits. *Electrical Characteristics* state DC and AC electrical specifications under particular test conditions which guarantee specific performance limits. This assumes that the device is within the Operating Ratings. Marshall Chiu feels there are better ways to obtain "More Wattage in the Cottage." Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) Typicals are measured at  $25^\circ C$  and represent the parametric norm.
- (4) Limits are guaranteed to National's AOQL (Average Outgoing Quality Level). Datasheet min/max specification limits are guaranteed by design, test, or statistical analysis.

## Electrical Characteristics for Bridged Mode Operation (continued)

(1) (2)

The following specifications apply for  $V_{DD} = 5V$ , unless otherwise noted. Limits apply for  $T_A = 25^\circ C$ .

Symbol	Parameter	Conditions	LM4843		Units (Limits)
			Typical (3)	Limit (4)	
$P_O$	Output Power	THD + N = 1.0%; $f=1kHz$ ; $R_L = 3\Omega$ (5)	2.2		W
		THD + N = 1.0%; $f=1kHz$ ; $R_L = 4\Omega$ (6)	2		W
		THD = 1% (max); $f = 1 kHz$ ; $R_L = 8\Omega$	1.1	1.0	W (min)
		THD+N = 10%; $f = 1 kHz$ ; $R_L = 8\Omega$	1.5		W
THD+N	Total Harmonic Distortion+Noise	$P_O = 1W$ , $20 Hz < f < 20 kHz$ , $R_L = 8\Omega$ , $A_{VD} = 2$	0.3		%
		$P_O = 340 mW$ , $R_L = 32\Omega$	1.0		%
PSRR	Power Supply Rejection Ratio	$C_B = 1.0 \mu F$ , $f = 120 Hz$ , $V_{RIPPLE} = 200 mV_{rms}$ ; $R_L = 8\Omega$	74		dB
SNR	Signal to Noise Ratio	$V_{DD} = 5V$ , $P_{OUT} = 1.1W$ , $R_L = 8\Omega$ , A-Wtd Filter	93		dB
$X_{talk}$	Channel Separation	$f=1kHz$ , $C_B = 1.0 \mu F$	70		dB

(5) When driving  $3\Omega$  loads from a 5V supply the LM4843MH must be mounted to the circuit board and forced-air cooled.

(6) When driving  $4\Omega$  loads from a 5V supply the LM4843MH must be mounted to the circuit board.

## Application Information

### EXPOSED-DAP PACKAGE PCB MOUNTING CONSIDERATIONS

The LM4843's exposed-DAP (die attach paddle) package (MH) provides a low thermal resistance between the die and the PCB to which the part is mounted and soldered. This allows rapid heat transfer from the die to the surrounding PCB copper traces, ground plane and, finally, surrounding air. The result is a low voltage audio power amplifier that produces 2.1W at ≤ 1% THD with a 4Ω load. This high power is achieved through careful consideration of necessary thermal design. Failing to optimize thermal design may compromise the LM4843's high power performance and activate unwanted, though necessary, thermal shutdown protection.

The MH package must have its exposed DAPs soldered to a grounded copper pad on the PCB. The DAP's PCB copper pad is connected to a large grounded plane of continuous unbroken copper. This plane forms a thermal mass heat sink and radiation area. Place the heat sink area on either outside plane in the case of a two-sided PCB, or on an inner layer of a board with more than two layers. Connect the DAP copper pad to the inner layer or backside copper heat sink area with 32(4x8) (MH) vias. The via diameter should be 0.012in–0.013in with a 1.27mm pitch. Ensure efficient thermal conductivity by plating-through and solder-filling the vias.

Best thermal performance is achieved with the largest practical copper heat sink area. If the heatsink and amplifier share the same PCB layer, a nominal 2.5in<sup>2</sup> (min) area is necessary for 5V operation with a 4Ω load. Heatsink areas not placed on the same PCB layer as the LM4843 MH package should be 5in<sup>2</sup> (min) for the same supply voltage and load resistance. The last two area recommendations apply for 25°C ambient temperature. Increase the area to compensate for ambient temperatures above 25°C. In systems using cooling fans, the LM4843MH can take advantage of forced air cooling. With an air flow rate of 450 linear-feet per minute and a 2.5in<sup>2</sup> exposed copper or 5.0in<sup>2</sup> inner layer copper plane heatsink, the LM4843MH can continuously drive a 3Ω load to full power. The junction temperature must be held below 150°C to prevent activating the LM4843's thermal shutdown protection. The LM4843's power de-rating curve in the **Typical Performance Characteristics** shows the maximum power dissipation versus temperature. Example PCB layouts for the exposed-DAP TSSOP package are shown in the **Demonstration Board Layout** section. Further detailed and specific information concerning PCB layout and fabrication is available in National Semiconductor's AN1187.

### PCB LAYOUT AND SUPPLY REGULATION CONSIDERATIONS FOR DRIVING 3Ω AND 4Ω LOADS

Power dissipated by a load is a function of the voltage swing across the load and the load's impedance. As load impedance decreases, load dissipation becomes increasingly dependent on the interconnect (PCB trace and wire) resistance between the amplifier output pins and the load's connections. Residual trace resistance causes a voltage drop, which results in power dissipated in the trace and not in the load as desired. For example, 0.1Ω trace resistance reduces the output power dissipated by a 4Ω load from 2.1W to 2.0W. This problem of decreased load dissipation is exacerbated as load impedance decreases. Therefore, to maintain the highest load dissipation and widest output voltage swing, PCB traces that connect the output pins to a load must be as wide as possible.

Poor power supply regulation adversely affects maximum output power. A poorly regulated supply's output voltage decreases with increasing load current. Reduced supply voltage causes decreased headroom, output signal clipping, and reduced output power. Even with tightly regulated supplies, trace resistance creates the same effects as poor supply regulation. Therefore, making the power supply traces as wide as possible helps maintain full output voltage swing.

## BRIDGE CONFIGURATION EXPLANATION

As shown in [Figure 3](#), the LM4843 output stage consists of two pairs of operational amplifiers, forming a two-channel (channel A and channel B) stereo amplifier. (Though the following discusses channel A, it applies equally to channel B.)

[Figure 3](#) shows that the first amplifier's negative (-) output serves as the second amplifier's input. This results in both amplifiers producing signals identical in magnitude, but 180° out of phase. Taking advantage of this phase difference, a load is placed between -OUTA and +OUTA and driven differentially (commonly referred to as "bridge mode"). This results in a differential gain of

$$A_{VD} = 2 * (R_f/R_i) \quad (1)$$

Bridge mode amplifiers are different from single-ended amplifiers that drive loads connected between a single amplifier's output and ground. For a given supply voltage, bridge mode has a distinct advantage over the single-ended configuration: **its differential output doubles the voltage swing across the load.** This produces four times the output power when compared to a single-ended amplifier under the same conditions. This increase in attainable output power assumes that the amplifier is not current limited or that the output signal is not clipped. To ensure minimum output signal clipping when choosing an amplifier's closed-loop gain, refer to the **Audio Power Amplifier Design** section.

Another advantage of the differential bridge output is no net DC voltage across the load. This is accomplished by biasing channel A's and channel B's outputs at half-supply. This eliminates the coupling capacitor that single supply, single-ended amplifiers require. Eliminating an output coupling capacitor in a single-ended configuration forces a single-supply amplifier's half-supply bias voltage across the load. This increases internal IC power dissipation and may permanently damage loads such as speakers.

## POWER DISSIPATION

Power dissipation is a major concern when designing a successful single-ended or bridged amplifier. [Equation 2](#) states the maximum power dissipation point for a single-ended amplifier operating at a given supply voltage and driving a specified output load.

$$P_{DMAX} = (V_{DD})^2 / (2\pi^2 R_L) \quad \text{Single-Ended} \quad (2)$$

However, a direct consequence of the increased power delivered to the load by a bridge amplifier is higher internal power dissipation for the same conditions.

The LM4843 has two operational amplifiers per channel. The maximum internal power dissipation per channel operating in the bridge mode is four times that of a single-ended amplifier. From [Equation 3](#), assuming a 5V power supply and a 4Ω load, the maximum single channel power dissipation is 1.27W or 2.54W for stereo operation.

$$P_{DMAX} = 4 * (V_{DD})^2 / (2\pi^2 R_L) \quad \text{Bridge Mode} \quad (3)$$

The LM4843's power dissipation is twice that given by [Equation 2](#) or [Equation 3](#) when operating in the single-ended mode or bridge mode, respectively. Twice the maximum power dissipation point given by [Equation 3](#) must not exceed the power dissipation given by [Equation 4](#):

$$P_{DMAX}' = (T_{JMAX} - T_A) / \theta_{JA} \quad (4)$$

The LM4843's  $T_{JMAX} = 150^{\circ}\text{C}$ . In the LQ package soldered to a DAP pad that expands to a copper area of  $5\text{in}^2$  on a PCB, the LM4843's  $\theta_{JA}$  is  $20^{\circ}\text{C/W}$ . In the MH package soldered to a DAP pad that expands to a copper area of  $2\text{in}^2$  on a PCB, the LM4843MH's  $\theta_{JA}$  is  $41^{\circ}\text{C/W}$ . For the LM4843MH package,  $\theta_{JA} = 80^{\circ}\text{C/W}$ . At any given ambient temperature  $T_A$ , use Equation 4 to find the maximum internal power dissipation supported by the IC packaging. Rearranging Equation 4 and substituting  $P_{DMAX}$  for  $P_{DMAX}'$  results in Equation 5. This equation gives the maximum ambient temperature that still allows maximum stereo power dissipation without violating the LM4843's maximum junction temperature.

$$T_A = T_{JMAX} - 2 * P_{DMAX} \theta_{JA} \quad (5)$$

For a typical application with a 5V power supply and an  $4\Omega$  load, the maximum ambient temperature that allows maximum stereo power dissipation without exceeding the maximum junction temperature is approximately  $99^{\circ}\text{C}$  for the LQ package and  $45^{\circ}\text{C}$  for the MH package.

$$T_{JMAX} = P_{DMAX} \theta_{JA} + T_A \quad (6)$$

Equation 6 gives the maximum junction temperature  $T_{JMAX}$ . If the result violates the LM4843's  $150^{\circ}\text{C}$   $T_{JMAX}$ , reduce the maximum junction temperature by reducing the power supply voltage or increasing the load resistance. Further allowance should be made for increased ambient temperatures.

The above examples assume that a device is a surface mount part operating around the maximum power dissipation point. Since internal power dissipation is a function of output power, higher ambient temperatures are allowed as output power or duty cycle decreases.

If the result of Equation 2 is greater than that of Equation 3, then decrease the supply voltage, increase the load impedance, or reduce the ambient temperature. If these measures are insufficient, a heat sink can be added to reduce  $\theta_{JA}$ . The heat sink can be created using additional copper area around the package, with connections to the ground pin(s), supply pin and amplifier output pins. External, solder attached MH heatsinks such as the Thermalloy 7106D can also improve power dissipation. When adding a heat sink, the  $\theta_{JA}$  is the sum of  $\theta_{JC}$ ,  $\theta_{CS}$ , and  $\theta_{SA}$ . ( $\theta_{JC}$  is the junction-to-case thermal impedance,  $\theta_{CS}$  is the case-to-sink thermal impedance, and  $\theta_{SA}$  is the sink-to-ambient thermal impedance.) Refer to the **Typical Performance Characteristics** curves for power dissipation information at lower output power levels.

## POWER SUPPLY BYPASSING

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection. Applications that employ a 5V regulator typically use a  $10\mu\text{F}$  in parallel with a  $0.1\mu\text{F}$  filter capacitor to stabilize the regulator's output, reduce noise on the supply line, and improve the supply's transient response. However, their presence does not eliminate the need for a local  $1.0\mu\text{F}$  tantalum bypass capacitance connected between the LM4843's supply pins and ground. Do not substitute a ceramic capacitor for the tantalum. Doing so may cause oscillation. Keep the length of leads and traces that connect capacitors between the LM4843's power supply pin and ground as short as possible. Connecting a  $1\mu\text{F}$  capacitor,  $C_B$ , between the BYPASS pin and ground improves the internal bias voltage's stability and the amplifier's PSRR. The PSRR improvements increase as the bypass pin capacitor value increases. Too large a capacitor, however, increases turn-on time and can compromise the amplifier's click and pop performance. The selection of bypass capacitor values, especially  $C_B$ , depends on desired PSRR requirements, click and pop performance (as explained in the following section, **Selecting Proper External Components**), system cost, and size constraints.

## SELECTING PROPER EXTERNAL COMPONENTS

Optimizing the LM4843's performance requires properly selecting external components. Though the LM4843 operates well when using external components with wide tolerances, best performance is achieved by optimizing component values.

The LM4843 is unity-gain stable, giving a designer maximum design flexibility. The gain should be set to no more than a given application requires. This allows the amplifier to achieve minimum THD+N and maximum signal-to-noise ratio. These parameters are compromised as the closed-loop gain increases. However, low gain circuits demand input signals with greater voltage swings to achieve maximum output power. Fortunately, many signal sources such as audio CODECs have outputs of  $1V_{RMS}$  ( $2.83V_{P-P}$ ). Please refer to the **Audio Power Amplifier Design** section for more information on selecting the proper gain.

### Input Capacitor Value Selection

Amplifying the lowest audio frequencies requires a high value input coupling capacitor ( $0.33\mu F$  in [Figure 3](#)), but high value capacitors can be expensive and may compromise space efficiency in portable designs. In many cases, however, the speakers used in portable systems, whether internal or external, have little ability to reproduce signals below 150 Hz. Applications using speakers with this limited frequency response reap little improvement by using a large input capacitor.

Besides effecting system cost and size, the input coupling capacitor has an affect on the LM4843's click and pop performance. When the supply voltage is first applied, a transient (pop) is created as the charge on the input capacitor changes from zero to a quiescent state. The magnitude of the pop is directly proportional to the input capacitor's size. Higher value capacitors need more time to reach a quiescent DC voltage (usually  $V_{DD}/2$ ) when charged with a fixed current. The amplifier's output charges the input capacitor through the feedback resistor,  $R_f$ . Thus, pops can be minimized by selecting an input capacitor value that is no higher than necessary to meet the desired -6dB frequency.

As shown in [Figure 3](#), the input resistor ( $R_{IR}$ ,  $R_{IL} = 20k$ ) ( and the input capacitor ( $C_{IR}$ ,  $C_{IL} = 0.33\mu F$ ) produce a -6dB high pass filter cutoff frequency that is found using [Equation 7](#).

$$f_{-6\text{ dB}} = \frac{1}{2\pi R_{IN} C_1} \quad (7)$$

As an example when using a speaker with a low frequency limit of 150Hz, the input coupling capacitor, using [Equation 7](#), is  $0.063\mu F$ . The  $0.33\mu F$  input coupling capacitor shown in [Figure 3](#) allows the LM4843 to drive a high efficiency, full range speaker whose response extends below 30Hz.

### OPTIMIZING CLICK AND POP REDUCTION PERFORMANCE

The LM4843 contains circuitry that minimizes turn-on and shutdown transients or “clicks and pops”. For this discussion, turn-on refers to either applying the power supply voltage or when the shutdown mode is deactivated. While the power supply is ramping to its final value, the LM4843's internal amplifiers are configured as unity gain buffers. An internal current source changes the voltage of the BYPASS pin in a controlled, linear manner. Ideally, the input and outputs track the voltage applied to the BYPASS pin. The gain of the internal amplifiers remains unity until the voltage on the bypass pin reaches  $1/2 V_{DD}$ . As soon as the voltage on the bypass pin is stable, the device becomes fully operational. Although the BYPASS pin current cannot be modified, changing the size of  $C_B$  alters the device's turn-on time and the magnitude of “clicks and pops”. Increasing the value of  $C_B$  reduces the magnitude of turn-on pops. However, this presents a tradeoff: as the size of  $C_B$  increases, the turn-on time increases. There is a linear relationship between the size of  $C_B$  and the turn-on time. Here are some typical turn-on times for various values of  $C_B$ :

$C_B$	$T_{ON}$
0.01 $\mu F$	2ms
0.1 $\mu F$	20ms
0.22 $\mu F$	44ms
0.47 $\mu F$	94ms
1.0 $\mu F$	200ms

## MICRO-POWER SHUTDOWN

The voltage applied to the SHUTDOWN pin controls the LM4843's shutdown function. Activate micro-power shutdown by applying  $V_{DD}$  to the SHUTDOWN pin. When active, the LM4843's micro-power shutdown feature turns off the amplifier's bias circuitry, reducing the supply current. The logic threshold is typically  $V_{DD}/2$ . The low 0.7  $\mu A$  typical shutdown current is achieved by applying a voltage that is as near as  $V_{DD}$  as possible to the SHUTDOWN pin. A voltage that is less than  $V_{DD}$  may increase the shutdown current.

There are a few ways to control the micro-power shutdown. These include using a single-pole, single-throw switch, a microprocessor, or a microcontroller. When using a switch, connect an external 10k $\Omega$  pull-up resistor between the SHUTDOWN pin and  $V_{DD}$ . Connect the switch between the SHUTDOWN pin and ground. Select normal amplifier operation by closing the switch. Opening the switch connects the SHUTDOWN pin to  $V_{DD}$  through the pull-up resistor, activating micro-power shutdown. The switch and resistor guarantee that the SHUTDOWN pin will not float. This prevents unwanted state changes. In a system with a microprocessor or a microcontroller, use a digital output to apply the control voltage to the SHUTDOWN pin. Driving the SHUTDOWN pin with active circuitry eliminates the need for a pull up resistor.

## DC VOLUME CONTROL

The LM4843 has an internal stereo volume control whose setting is a function of the DC voltage applied to the DC VOL CONTROL pin.

The LM4843 volume control consists of 31 steps that are individually selected by a variable DC voltage level on the volume control pin. The range of the steps, controlled by the DC voltage, are from 0dB - 78dB. Each attenuation step corresponds to a specific input voltage range, as shown in [Table 2](#).

To minimize the effect of noise on the volume control pin, which can affect the selected attenuation level, hysteresis has been implemented. The amount of hysteresis corresponds to half of the step width, as shown in Volume Control Characterization Graph (DS200133-40).

For highest accuracy, the voltage shown in the 'recommended voltage' column of the table is used to select a desired attenuation level. This recommended voltage is exactly halfway between the two nearest transitions to the next highest or next lowest attenuation levels.

The attenuation levels are 1dB/step from 0dB to -6dB, 2dB/step from -6dB to -36dB, 3dB/step from -36dB to -47dB, 4dB/step from -47dB to -51dB, 5dB/step from -51dB to -66dB, and 12dB to the last step at -78dB.

**Table 2. Volume Control Table**

Gain (dB)	Voltage Range (% of Vdd)			Voltage Range (Vdd = 5)			Voltage Range (Vdd = 3)

**AUDIO POWER AMPLIFIER DESIGN****Audio Amplifier Design: Driving 1W into an 8Ω Load**

The following are the desired operational parameters:

Power Output:	1 W <sub>RMS</sub>
Load Impedance:	8Ω
Input Level:	1 V <sub>RMS</sub>
Input Impedance:	20 kΩ
Bandwidth:	100 Hz–20 kHz ± 0.25 dB

The design begins by specifying the minimum supply voltage necessary to obtain the specified output power. One way to find the minimum supply voltage is to use the Output Power vs Supply Voltage curve in the **Typical Performance Characteristics** section. Another way, using [Equation 10](#), is to calculate the peak output voltage necessary to achieve the desired output power for a given load impedance. To account for the amplifier's dropout voltage, two additional voltages, based on the Dropout Voltage vs Supply Voltage in the **Typical Performance Characteristics** curves, must be added to the result obtained by [Equation 10](#). The result is [Equation 11](#).

$$V_{\text{outpeak}} = \sqrt{(2R_L P_O)} \quad (8)$$

$$V_{DD} \geq (V_{\text{OUTPEAK}} + (V_{\text{ODTOP}} + V_{\text{ODBOT}})) \quad (9)$$

The Output Power vs Supply Voltage graph for an 8Ω load indicates a minimum supply voltage of 4.6V. This is easily met by the commonly used 5V supply voltage. The additional voltage creates the benefit of headroom, allowing the LM4843 to produce peak output power in excess of 1W without clipping or other audible distortion. The choice of supply voltage must also not create a situation that violates of maximum power dissipation as explained above in the **Power Dissipation** section.

After satisfying the LM4843's power dissipation requirements, the minimum differential gain needed to achieve 1W dissipation in an 8Ω load is found using [Equation 12](#).

$$A_{VD} \geq \sqrt{(P_{O\max})/(V_{IN})} = V_{O\max}/V_{inrms} \quad (10)$$

Thus, a minimum overall gain of 2.83 allows the LM4843's to reach full output swing and maintain low noise and THD+N performance.

The last step in this design example is setting the amplifier's -6dB frequency bandwidth. To achieve the desired  $\pm 0.25$ dB pass band magnitude variation limit, the low frequency response must extend to at least one-fifth the lower bandwidth limit and the high frequency response must extend to at least five times the upper bandwidth limit. The gain variation for both response limits is 0.17dB, well within the  $\pm 0.25$ dB desired limit. The results are an

$$f_L = 100\text{Hz}/5 = 20\text{Hz} \quad (11)$$

and an

$$f_H = 20\text{kHz} \times 5 = 100\text{kHz} \quad (12)$$

As mentioned in the **Selecting Proper External Components** section,  $R_i$  (Right & Left) and  $C_i$  (Right & Left) create a highpass filter that sets the amplifier's lower bandpass frequency limit. Find the input coupling capacitor's value using [Equation 14](#).

$$C_i \geq 1/(2\pi R_i f_L) \quad (13)$$

The result is

$$1/(2\pi \times 20\text{k}\Omega \times 20\text{Hz}) = 0.397\mu\text{F} \quad (14)$$

Use a 0.39 $\mu$ F capacitor, the closest standard value.

The product of the desired high frequency cutoff (100kHz in this example) and the differential gain  $A_{VD}$ , determines the upper passband response limit. With  $A_{VD} = 3$  and  $f_H = 100\text{kHz}$ , the closed-loop gain bandwidth product (GBWP) is 300kHz. This is less than the LM4843's 3.5MHz GBWP. With this margin, the amplifier can be used in designs that require more differential gain while avoiding performance, restricting bandwidth limitations.

## Recommended Printed Circuit Board Layout

[Figure 4](#) through [Figure 6](#) show the recommended four-layer PC board layout that is optimized for the 24-pin LQ-packaged LM4843 and associated external components. This circuit is designed for use with an external 5V supply and 4 $\Omega$  speakers.

This circuit board is easy to use. Apply 5V and ground to the board's  $V_{DD}$  and GND pads, respectively. Connect 4 $\Omega$  speakers between the board's -OUTA and +OUTA and OUTB and +OUTB pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
