

LM6165/LM6265/LM6365 High Speed Operational Amplifier

General Description

The LM6165 family of high-speed amplifiers exhibits an excellent speed-power product in delivering 300 V/ μ s and 725 MHz GBW (stable for gains as low as +25) with only 5 mA of supply current. Further power savings and application convenience are possible by taking advantage of the wide dynamic range in operating supply voltage which extends all the way down to +5V.

These amplifiers are built with National's VIPTM (Vertically Integrated PNP) process which produces fast PNP transistors that are true complements to the already fast NPN devices. This advanced junction-isolated process delivers high speed performance without the need for complex and expensive dielectric isolation.

Features

- High slew rate 300 V/ μ s
- High GBW product 725 MHz
- Low supply current 5 mA
- Fast settling 80 ns to 0.1%
- Low differential gain <0.1%
- Low differential phase <0.1°
- Wide supply range 4.75V to 32V
- Stable with unlimited capacitive load
- Well behaved; easy to apply

Applications

- Video amplifier
- Wide-bandwidth signal conditioning

Simplified Schematic

Order Number LM6165J or LM6265J
See NS Package Number J08A

Order Number LM6365M
See NS Package Number M08A

Order Number LM6265N or
LM6365N
See NS Package Number N08E

Absolute Maximum Ratings

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ($V^+ - V^-$)	36V
Differential Input Voltage (Note 8)	$\pm 8V$
Common-Mode Voltage Range (Note 12)	$(V^+ - 0.7V)$ to $(V^- - 7V)$
Output Short Circuit to GND (Note 1)	Continuous
Soldering Information	
Dual-In-Line Package (N, J)	
Soldering (10 sec.)	260°C
Small Outline Package (M)	
Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C

See AN-450 "Surface Mounting Methods and Their Effect on Product Reliability" for other methods of soldering surface mount devices.

Storage Temp Range	-65°C to $+150^\circ\text{C}$
Max Junction Temperature (Note 2)	150°C
ESD Tolerance (Notes 8 and 9)	$\pm 700V$

Operating Ratings

Temperature Range (Note 2)	
LM6165	$-55^\circ\text{C} \leq T_J \leq +125^\circ\text{C}$
LM6265	$-25^\circ\text{C} \leq T_J \leq +85^\circ\text{C}$
LM6365	$0^\circ\text{C} \leq T_J \leq +70^\circ\text{C}$
Supply Voltage Range	4.75V to 32V

DC Electrical Characteristics (Note 3)

Parameter	Conditions	Typ	LM6165		LM6265		LM6365		Units

Input Noise Current	F = 10 kHz	1.5							pA/ $\sqrt{\text{Hz}}$

Note 1: Continuous short-circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C.

Note 2: The typical junction-to-ambient thermal resistance of the molded plastic DIP (N) is 105°C/Watt, and the molded plastic SO (M) package is 155°C/Watt, and the cerdip (J) package is 125°C/Watt. All numbers apply for packages soldered directly into a printed circuit board.

Note 3: Unless otherwise specified, all limits guaranteed for $T_A = T_J = 25^\circ\text{C}$ with supply voltage = $\pm 15\text{V}$, $V_{CM} = 0\text{V}$, and $R_L \geq 100\text{ k}\Omega$. **Boldface** limits apply over the range listed under "Operating Temperature Range".

Note 4: All limits guaranteed at room temperature (standard type face) and at **temperature extremes (bold type face)**. All limits are 100% production tested.

Note 5: All limits guaranteed at room temperature (standard type face) and at **temperature extremes (bold type face)**. All limits are guaranteed via correlation using standard Statistical Quality Control (SQC) methods.

Note 6: For single supply operation, the following conditions apply: $V_+ = 5\text{V}$, $V_- = 0\text{V}$, $V_{CM} = 2.5\text{V}$, $V_{OUT} = 2.5\text{V}$. Pin 1 & Pin 8 (V_{OS} Adjust) are each connected to Pin 4 (V_-) to realize maximum output swing. This connection will degrade V_{OS} .

Note 7: $C_L \leq 5\text{ pF}$.

Note 8: In order to achieve optimum AC performance, the input stage was designed without protective clamps. Exceeding the maximum differential input voltage results in reverse breakdown of the base-emitter junction of one of the input transistors and probable degradation of the input parameters (especially V_{OS} , I_{OS} , and Noise).

Note 9: The average voltage that the weakest pin combinations (those involving Pin 2 or Pin 3) can withstand and still conform to the datasheet limits. The test circuit used consists of the human body model of 100 pF in series with 1500 Ω .

Note 10: $V_{IN} = 0.7\text{V}$ step. For supply = $\pm 5\text{V}$, $V_{IN} = 0.2\text{V}$ step.

Note 11: Voltage Gain is the total output swing (20V) divided by the input signal required to produce that swing.

Note 12: The voltage between V_+ and either input pin must not exceed 36V.

Typical Performance Characteristics $R_L = 10\text{ k}\Omega$, $T_A = 25^\circ\text{C}$ unless otherwise specified

Typical Performance Characteristics (Continued)

Applications Tips

The LM6365 has no frequency compensation, but is stable for gains of 25 or greater (over the specified ranges of temperature, power supply voltage, and load). The LM6365 and LM6364, specified in separate datasheets, are compensated versions of the LM6365. The LM6361 is unity-gain stable, while the LM6364 is stable for gains as low as 5. The LM6361, and LM6364 have the same high slew rate as the LM6365, typically 300 V/ μ s.

To use the LM6365 for gains less than 25, a series resistor-capacitor network should be added between the input pins (as shown in the Typical Applications, Noise Gain Compensation) so that the high-frequency noise gain rises to at least 25.

Power supply bypassing will improve stability and transient response of the LM6365, and is recommended for every

design. 0.01 μ F to 0.1 μ F ceramic capacitors should be used (from each supply "rail" to ground); an additional 2.2 μ F to 10 μ F (tantalum) may be required for extra noise reduction.

Keep all leads short to reduce stray capacitance and lead inductance, and make sure ground paths are low-impedance, especially where heavier currents will be flowing. Stray capacitance in the circuit layout can cause signal coupling between adjacent nodes, and can cause circuit gain to unintentionally vary with frequency.

Breadboarded circuits will work best if they are built using generic PC boards with a good ground plane. If the op amps are used with sockets, as opposed to being soldered into the circuit, the additional input capacitance may degrade circuit performance.

Typical Applications

Offset Voltage Adjustment

TL/H/9152-11

Noise-Gain Compensation

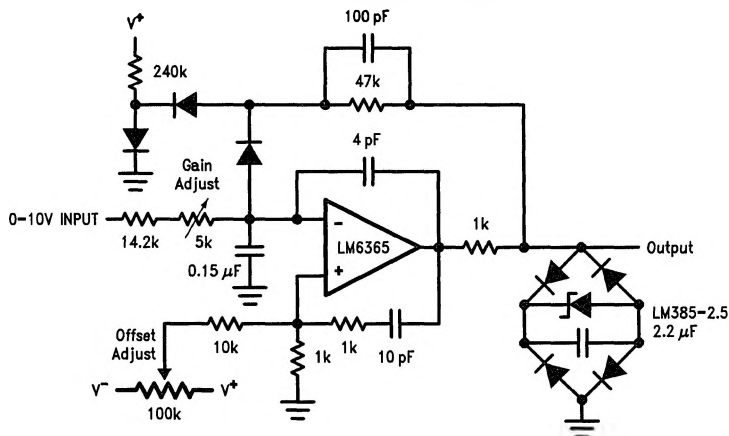

TL/H/9152-12

$$R_X C_X \geq \frac{1}{2\pi} \cdot 25 \text{ MHz}$$

$$[R_1 + R_F (1 + R_1/R_2)] = 25 R_X$$

1 MHz Voltage-to-Frequency Converter

($f_{OUT} = 1 \text{ MHz}$ for $V_{IN} = 10 \text{ V}$)
