

## Enhanced Plastic Dual 150mA Ultra Low-Dropout Regulator

Check for Samples: [LP2966EP](#)

### FEATURES

- Ultra low drop-out voltage
- Low ground pin current
- <math>1\mu\text{A}</math> quiescent current in shutdown mode
- Independent shutdown of each LDO regulator
- Output voltage accuracy  $\pm 1\%$
- Guaranteed 150mA output current at each output
- Low output noise
- Error Flags indicate status of each output

- Available in MSOP-8 surface mount packages
- Low output capacitor requirements (1 $\mu\text{F}$ )
- Operates with Low ESR ceramic capacitors in most applications
- Over temperature/over current protection

### APPLICATIONS

- GPS systems
- Selected Military Applications
- Selected Avionics Applications

### DESCRIPTION

The LP2966EP dual ultra low-dropout (LDO) regulator operates from a +2.70V to +7.0V input supply. Each output delivers 150mA over full temperature range. The IC operates with extremely low drop-out voltage and quiescent current, which makes it very suitable for battery powered and portable applications. Each LDO in the LP2966EP has independent shutdown capability. The LP2966EP provides low noise performance with low ground pin current in an extremely small MSOP-8 package (refer to package dimensions and connection diagram for more information on MSOP-8 package). A wide range of preset voltage options are available for each output. In addition to the voltage combinations listed in the ordering information table, many more are available upon request with minimum orders. In all, 256 voltage combinations are possible.

### ENHANCED PLASTIC

- Extended Temperature Performance of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Baseline Control - Single Fab & Assembly Site
- Process Change Notification (PCN)
- Qualification & Reliability Data
- Solder (PbSn) Lead Finish is standard
- Enhanced Diminishing Manufacturing Sources (DMS) Support

**Table 1. Key Specifications**

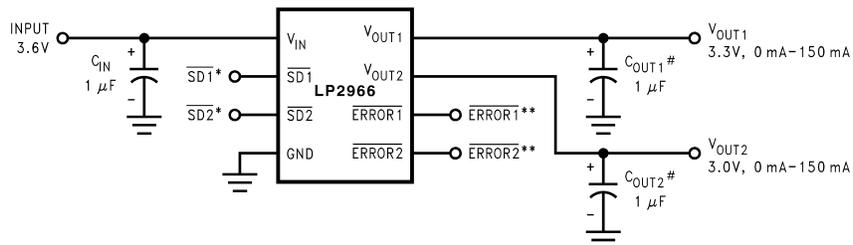

<b>Dropout Voltage:</b> Varies linearly with load current. Typically 0.9 mV at 1mA load current and 135mV at 150mA load current.
<b>Ground Pin Current:</b> Typically 300 $\mu\text{A}$ at 1mA load current and 340 $\mu\text{A}$ at 100mA load current (with one shutdown pin pulled low).
<b>Shutdown Mode:</b> Less than 1 $\mu\text{A}$ quiescent current when both shutdown pins are pulled low.
<b>Error Flag:</b> Open drain output, goes low when the corresponding output drops 10% below nominal.
<b>Precision Output Voltage:</b> Multiple output voltage options available ranging from 1.8V to 5.0V with a guaranteed accuracy of $\pm 1\%$ at room temperature.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

## Typical Application Circuit

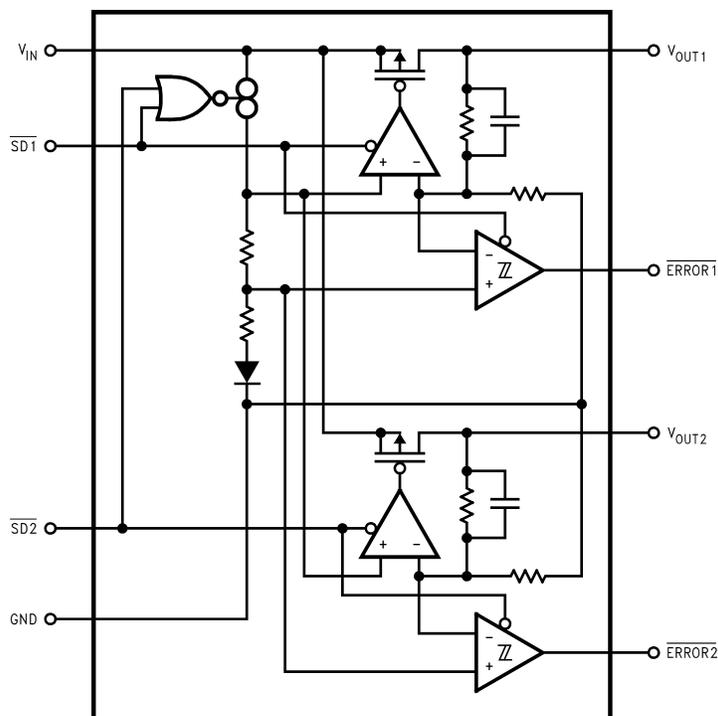

\*SD1 and SD2 must be actively terminated through a pull up resistor. Tie to V<sub>IN</sub> if not used.

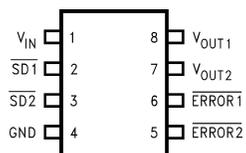

\*\*ERROR1 and ERROR2 are open drain outputs. These pins must be connected to ground if not used.

# Minimum output capacitance is 1µF to insure stability over full load current range. More capacitance improves superior dynamic performance and provides additional stability margin.

## Block Diagram

## Connection Diagram

**Figure 1. Top View  
Mini SO-8 Package  
8-Lead Small Outline Integrated Circuit (SOIC)**

**Table 2. Pin Descriptions**

Pin	Name	Function
1	VIN	Input Supply pin
2	$\overline{\text{SD1}}$	Active low shutdown pin for output 1
3	$\overline{\text{SD2}}$	Active low shutdown pin for output 2
4	GND	Ground
5	$\overline{\text{ERROR2}}$	Error flag for output 2 - Normally high impedance, should be connected to ground if not used.
6	$\overline{\text{ERROR1}}$	Error flag for output 1 - Normally high impedance, should be connected to ground if not used.
7	VOUT2	Output 2
8	VOUT1	Output 1

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### Absolute Maximum Ratings <sup>(1)</sup>

Storage Temperature Range	-65 to +150°C
Lead Temp. (Soldering, 5 sec.)	260°C
Power Dissipation <sup>(2)</sup>	Internally Limited
ESD Rating <sup>(3)</sup>	2kV
Input Supply Voltage (Survival)	-0.3V to 7.5V
Shutdown Input Voltage (Survival)	-0.3V to (VIN + 0.3V)
Maximum Voltage for $\overline{\text{ERROR}}$ Pins	10V
I <sub>OUT</sub> (Survival)	Short Circuit Protected
Output Voltage (Survival) <sup>(4), (5)</sup>	-0.3V to (VIN + 0.3V)

- (1) Absolute maximum ratings indicate limits beyond which damage to the device may occur. Operating ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see Electrical characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- (2) At elevated temperatures, devices must be derated based on package thermal resistance. The device in the surface-mount package must be derated at  $\theta_{JA} = 235^\circ\text{C}/\text{W}$ , junction-to-ambient. Please refer to the applications section on maximum current capability for further information. The device has internal thermal protection.
- (3) The human body model is a 100pF capacitor discharged through a 1.5k $\Omega$  resistor into each pin.
- (4) If used in a dual-supply system where the regulator load is returned to a negative supply, the LP2966EP output must be diode-clamped to ground.
- (5) The output PMOS structure contains a diode between the V<sub>IN</sub> and V<sub>OUT</sub> terminals that is normally reverse-biased. Reversing the polarity from V<sub>IN</sub> and V<sub>OUT</sub> will turn on this diode.

### Operating Ratings <sup>(1)</sup>

Input Supply Voltage	2.7V to 7.0V
Shutdown Input Voltage	-0.3V to (VIN + 0.3V)
Operating Junction Temperature Range	-40°C to +125°C
Maximum Voltage for $\overline{\text{ERROR}}$ pins	10V

- (1) Absolute maximum ratings indicate limits beyond which damage to the device may occur. Operating ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see Electrical characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

## Electrical Characteristics

Limits in standard typeface are for  $T_j = 25^\circ\text{C}$ , and limits in **boldface type** apply over the full operating junction temperature range. Unless otherwise specified,  $V_{IN} = V_{O(NOM)} + 1\text{V}$ , <sup>(1)</sup>,  $C_{OUT} = 1\mu\text{F}$ ,  $I_{OUT} = 1\text{mA}$ ,  $C_{IN} = 1\mu\text{F}$ ,  $V_{SD1} = V_{SD2} = V_{IN}$ .

Symbol	Parameter	Conditions	Typ <sup>(2)</sup>	LP2966IMMEP <sup>(3)</sup>		Unit
				Min	Max	
$V_O$ <sup>(4)</sup>	Output Voltage Tolerance	$V_{OUT} + 1\text{V} < V_{IN} < 7.0\text{V}$	0.0	-1	1	% $V_{NOM}$
		$1\text{mA} < I_L < 100\text{mA}$	0.0	-3	3	% $V_{NOM}$
$\Delta V_O/\Delta V_{IN}$ <sup>(5)</sup> (4)	Output Voltage Line Regulation		0.1			mV/V
$\Delta V_O/\Delta I_{OUT}$	Output Voltage Load Regulation <sup>(6)</sup>	$1\text{mA} < I_L < 100\text{mA}$ <sup>(6)</sup>	0.1			mV/mA
$\Delta V_{O2}/\Delta I_{OUT1}$	Output Voltage Cross Regulation <sup>(7)</sup>	$1\text{mA} < I_{L1} < 100\text{mA}$ <sup>(7)</sup>	0.0004			mV/mA
$V_{IN} - V_{OUT}$	Dropout Voltage <sup>(8)</sup>	$I_L = 1\text{mA}$	0.9		2.0	mV
		$I_L = 100\text{mA}$	90		130	
		$I_L = 150\text{mA}$	135		195	
$I_{GND(1,0)}$ <sup>(9)</sup>	Ground Pin Current (One LDO On)	$I_L = 1\text{mA}$	<b>300</b>		<b>3.0</b>	$\mu\text{A}$
		$V_{SD2} \leq 0.1\text{V}$ , $V_{SD1} = V_{IN}$				
		$I_L = 100\text{mA}$	<b>340</b>		<b>180</b>	
$I_{GND(1,1)}$	Ground Pin Current (Both LDOs On)	$I_L = 1\text{mA}$	340		450	$\mu\text{A}$
		$I_L = 100\text{mA}$	420		540	
					<b>600</b>	
$I_{GND(0,0)}$	Ground Pin Current in Shutdown Mode	$V_{SD1} = V_{SD2} \leq 0.1\text{V}$	0.006		0.3 <b>10</b>	$\mu\text{A}$
$I_{O(PK)}$	Peak Output Current	<sup>(10)</sup> $V_{OUT} \geq V_{OUT(NOM)} - 5\%$	500	350 <b>150</b>		mA
<b>Short Circuit Foldback Protection</b>						
$I_{FB}$	Short Circuit Foldback Knee	<sup>(10)</sup> , <sup>(11)</sup>	600			mA

- (1) The condition  $V_{IN} = V_{O(NOM)} + 1\text{V}$  applies when  $V_{out1} = V_{out2}$ . If  $V_{out1} \neq V_{out2}$ , then this condition would apply to the output which is greater in value. As an example, if  $V_{out1} = 3.3\text{V}$  and  $V_{out2} = 5\text{V}$ , then the condition  $V_{IN} = V_{O(NOM)} + 1\text{V}$  would apply to  $V_{out2}$  only.
- (2) : Typical numbers are at  $25^\circ\text{C}$  and represent the most likely parametric norm.
- (3) : Limits are 100% production tested at  $25^\circ\text{C}$ . Limits over the operating temperature range are guaranteed through correlation using Statistical Quality Control (SQC) methods. The limits are used to calculate National's Averaging Outgoing Quality Level (AOQL).
- (4) Output voltage tolerance specification also includes the line regulation and load regulation.
- (5) Output voltage line regulation is defined as the change in output voltage from the nominal value due to change in input line voltage.
- (6) Output voltage load regulation is defined as the change in output voltage from the nominal value when the load current changes from 1mA to 100mA.
- (7) Output voltage cross regulation is defined as the percentage change in the output voltage from the nominal value at one output when the load current changes from 1mA to full load in the other output. This is an important parameter in multiple output regulators. The specification for  $\Delta V_{O1}/\Delta I_{OUT2}$  is equal to the specification for  $\Delta V_{O2}/\Delta I_{OUT1}$ .
- (8) Dropout voltage is defined as the input to output differential at which the output voltage drops 100mV below the nominal value. Drop-out voltage specification applies only to output voltages greater than 2.7V. For output voltages below 2.7V, the drop-out voltage is nothing but the input to output differential, since the minimum input voltage is 2.7V.
- (9) The limits for the ground pin current specification,  $I_{GND(0,1)}$  will be same as the limits for the specification,  $I_{GND(1,0)}$ .
- (10) At elevated temperatures, devices must be derated based on package thermal resistance. The device in the surface-mount package must be derated at  $\theta_{JA} = 235^\circ\text{C/W}$ , junction-to-ambient. Please refer to the applications section on maximum current capability for further information. The device has internal thermal protection.
- (11) LP2966EP has fold back current limited short circuit protection. The knee is the current at which the output voltage drops 10% below the nominal value.

**Electrical Characteristics (continued)**

Limits in standard typeface are for  $T_j = 25^\circ\text{C}$ , and limits in **boldface type** apply over the full operating junction temperature range. Unless otherwise specified,  $V_{IN} = V_{O(NOM)} + 1\text{V}$ , <sup>(1)</sup>,  $C_{OUT} = 1\mu\text{F}$ ,  $I_{OUT} = 1\text{mA}$ ,  $C_{IN} = 1\mu\text{F}$ ,  $V_{SD1} = V_{SD2} = V_{IN}$ .

Symbol	Parameter	Conditions	Typ (2)	LP2966IMMEP <sup>(3)</sup>		Unit

$e_n$	Output Noise Voltage (rms)	$\text{BW} = 10\text{Hz} - 100\text{kHz}$ , $C_{OUT} = 10\mu\text{F}$	150			$\mu\text{V(rms)}$
		$\text{BW} = 300\text{Hz} - 300\text{kHz}$ , $C_{OUT} = 10\mu\text{F}$	100			

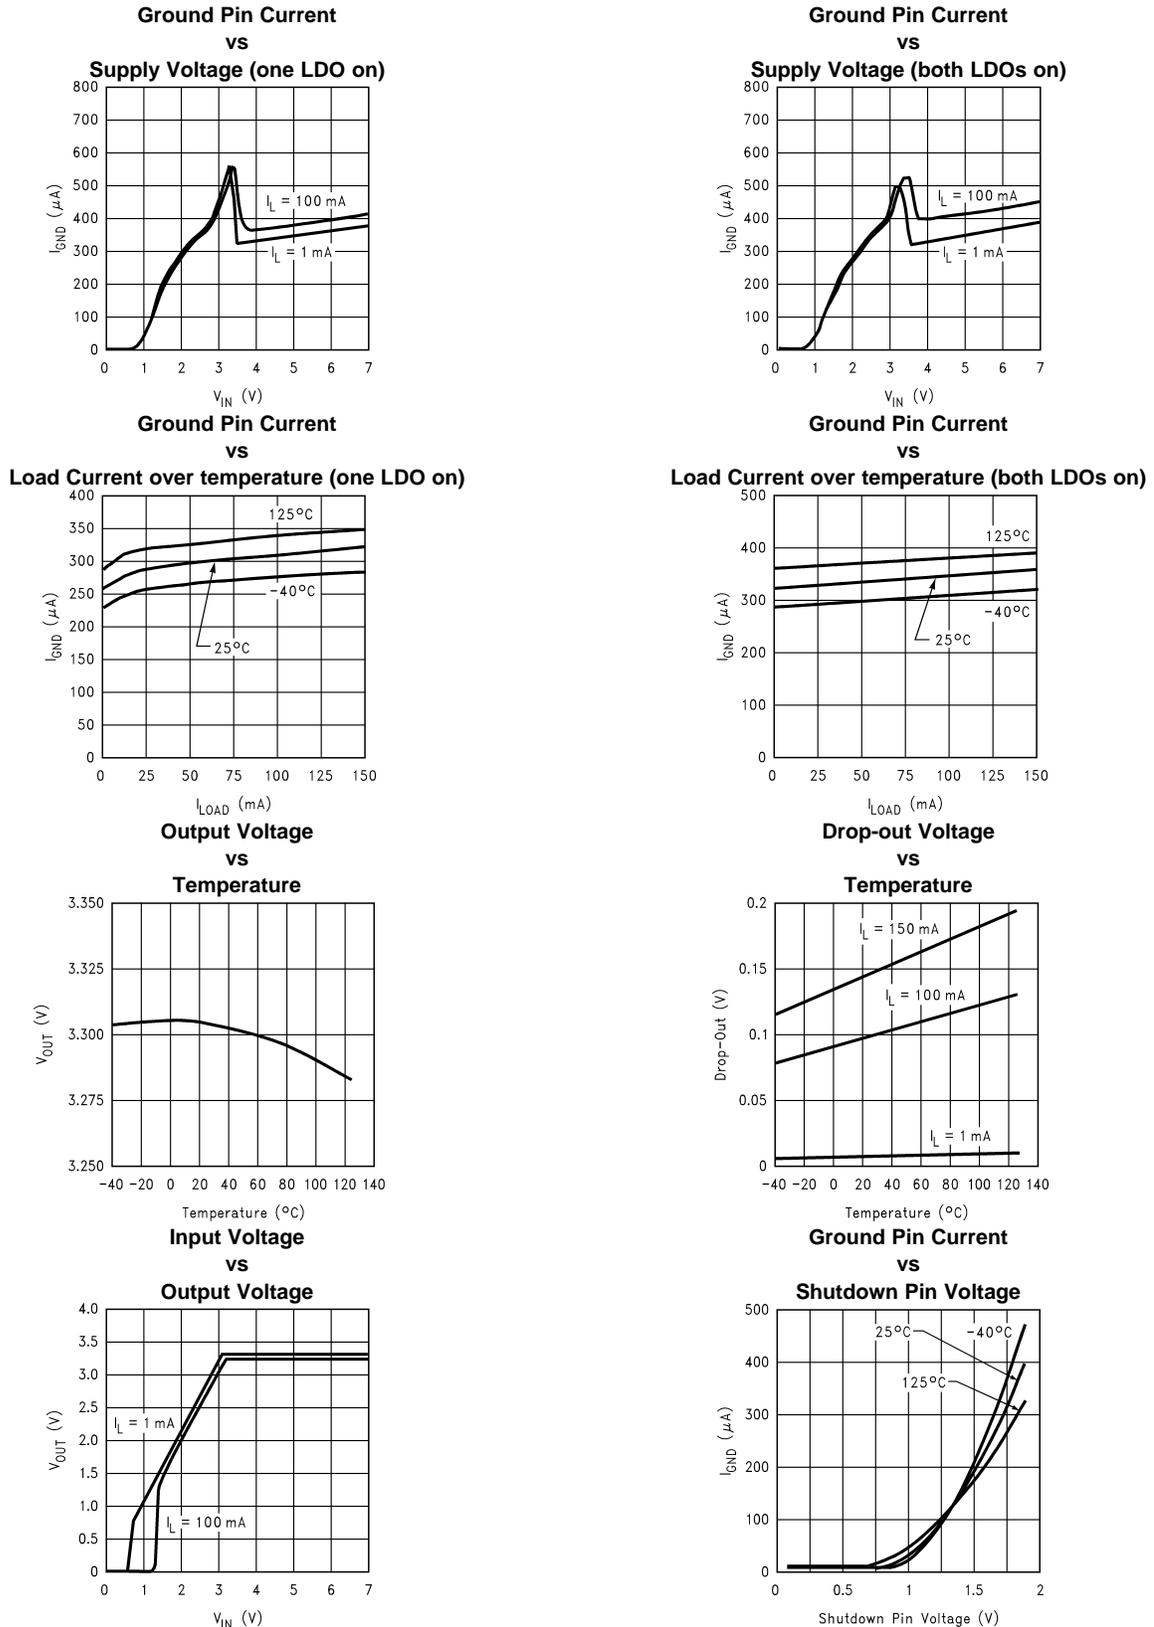

(12)  $V_{SDT}$  is the shutdown pin voltage threshold below which the output is disabled.

(13) Turn-on delay is the time interval between the low to high transition on the shutdown pin to the output voltage settling to within 5% of the nominal value. Turn-off delay is the time interval between the high to low transition on the shutdown pin to the output voltage dropping below 50% of the nominal value. The external load impedance influences the output voltage decay in shutdown mode.

(14) Error Flag threshold and hysteresis are specified as the percentage below the regulated output voltage.

### Typical Performance Characteristics

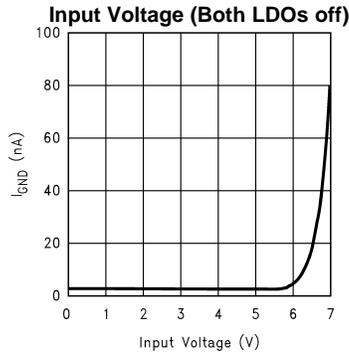

Unless otherwise specified,  $V_{IN} = V_{O(NOM)} + 1V$ ,  $V_{OUT} = 3.3V$ ,  $C_{OUT} = 1\mu F$ ,  $I_{OUT} = 1mA$ ,  $C_{IN} = 1\mu F$ ,  $V_{SD1} = V_{SD2} = V_{IN}$ , and  $T_A = 25^\circ C$ .

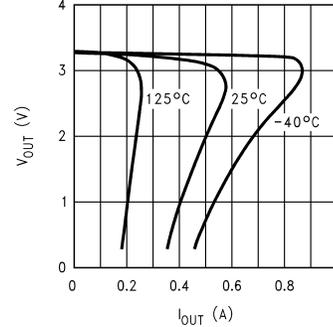

### Typical Performance Characteristics (continued)

Unless otherwise specified,  $V_{IN} = V_{O(NOM)} + 1V$ ,  $V_{OUT} = 3.3V$ ,  $C_{OUT} = 1\mu F$ ,  $I_{OUT} = 1mA$ ,  $C_{IN} = 1\mu F$ ,  $V_{SD1} = V_{SD2} = V_{IN}$ , and  $T_A = 25^\circ C$ .

## Applications Information

### INPUT CAPACITOR SELECTION

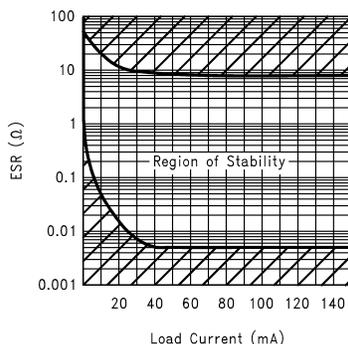

LP2966EP requires a minimum input capacitance of  $1\mu F$  between the input and ground pins to prevent any impedance interactions with the supply. This capacitor should be located very close to the input pin. This capacitor can be of any type such as ceramic, tantalum, or aluminium. Any good quality capacitor which has good tolerance over temperature and frequency is recommended.

### OUTPUT CAPACITOR SELECTION

The LP2966EP requires a minimum of  $1\mu F$  capacitance on each output for proper operation. To insure stability, this capacitor should maintain its ESR (equivalent series resistance) in the stable region of the ESR curves (Figure 2 and Figure 3) over the full operating temperature range of the application. The output capacitor should have a good tolerance over temperature, voltage, and frequency. The output capacitor can be increased without limit. Larger capacitance provides better stability and noise performance. The output capacitor should be connected very close to the  $V_{out}$  pin of the IC.

**Figure 2. ESR Curve for  $V_{OUT} = 5V$  and  $C_{OUT} = 2.2\mu F$**

**Figure 3. ESR Curve for  $V_{OUT} = 3.3V$  and  $C_{OUT} = 2.2\mu F$**

LP2966EP works best with Tantalum capacitors. However, the ESR and the capacitance value of these capacitors vary a lot with temperature, voltage, and frequency. So while using Tantalum capacitors, it should be ensured that the ESR is within the limits for stability over the full operating temperature range.

For output voltages greater than 2.5V, good quality ceramic capacitors (such as the X7R series from Taiyoyuden) can also be used with LP2966EP in applications not requiring light load operation (< 5mA for the 5V output option). Once again, it should be ensured that the capacitance value and the ESR are within the limits for stability over the full operating temperature range.

The ESRD Series Polymer Aluminium Electrolytic capacitors from Cornell Dubilier are very stable over temperature and frequency. The excellent capacitance and ESR tolerance of these capacitors over voltage, temperature and frequency make these capacitors very suitable for use with LDO regulators.

## OUTPUT NOISE

Noise is specified in two ways-

**Spot Noise** or **Output noise density** is the RMS sum of all noise sources, measured at the regulator output, at a specific frequency (measured with a 1Hz bandwidth). This type of noise is usually plotted on a curve as a function of frequency.

**Total output Noise** or **Broad-band noise** is the RMS sum of spot noise over a specified bandwidth, usually several decades of frequencies.

Attention should be paid to the units of measurement. Spot noise is measured in units  $\mu V/\sqrt{Hz}$  or  $nV/\sqrt{Hz}$  and total output noise is measured in  $\mu V(rms)$ .

The primary source of noise in low-dropout regulators is the internal reference. In CMOS regulators, noise has a low frequency component and a high frequency component, which strongly depend on the silicon area and quiescent current. Noise can be reduced in two ways: by increasing the transistor area or by increasing the current drawn by the internal reference. Increasing the area will increase the die size and decreases the chance of fitting the die into a small package. Increasing the current drawn by the internal reference increases the total supply current (ground pin current) of the IC. Using an optimized trade-off of ground pin current and die size, LP2966EP achieves low noise performance with low quiescent current in an MSOP-8 package.

### SHORT-CIRCUIT FOLDBACK PROTECTION

In the presence of a short or excessive load current condition, the LP2966EP uses an internal short circuit foldback mechanism that regulates the maximum deliverable output current. A strong negative temperature coefficient is designed into the circuit to enable extremely higher peak output current capability (in excess of 400mA per output at room temperature, see typical curves). Thus, a system designer using the LP2966EP can achieve higher peak output current capability in applications where the LP2966EP internal junction temperature is kept below 125°C. Refer to the applications section on calculating the maximum output current capability of the LP2966EP for your application.

### ERROR FLAG OPERATION

The LP2966EP produces a logic low signal at the Error Flag pin ( $\overline{\text{ERROR}}$ ) when the corresponding output drops out of regulation due to low input voltage, current limiting, or thermal limiting. This flag has a built in Hysteresis. The timing diagram in Figure 4 shows the relationship between the  $\overline{\text{ERROR}}$  and the output voltage. In this example, the input voltage is changed to demonstrate the functionality of the Error Flag.

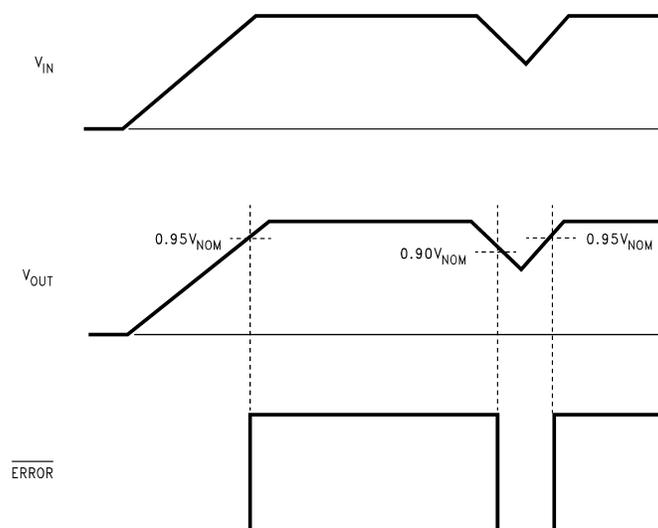

Figure 4. Error Flag Operation

The internal error flag comparators have open drain output stages. Hence, the  $\overline{\text{ERROR}}$  pins should be pulled high through a pull up resistor. Although the  $\overline{\text{ERROR}}$  pin can sink current of 1mA, this current adds to the battery drain. Hence, the value of the pull up resistor should be in the range of 100k $\Omega$  to 1M $\Omega$ . **The  $\overline{\text{ERROR}}$  pins must be connected to ground if this function is not used.** It should also be noted that when the shutdown pins are pulled low, the  $\overline{\text{ERROR}}$  pins are forced to be invalid for reasons of saving power in shutdown mode.

### SHUTDOWN OPERATION

The two LDO regulators in the LP2966EP have independent shutdown. A CMOS Logic level signal at the shutdown ( $\overline{\text{SD}}$ ) pin will turn-off the corresponding regulator. Pins  $\overline{\text{SD1}}$  and  $\overline{\text{SD2}}$  must be actively terminated through a 100k $\Omega$  pull-up resistor for a proper operation. If these pins are driven from a source that actively pulls high and low (such as a CMOS rail to rail comparator), the pull-up resistor is not required. These pins must be tied to  $V_{in}$  if not used.

## DROP-OUT VOLTAGE

The drop-out voltage of a regulator is defined as the minimum input-to-output differential required to stay within 100mV of the output voltage measured with a 1V differential. The LP2966EP uses an internal MOSFET with an  $R_{ds(on)}$  of 1 $\Omega$ . For CMOS LDOs, the drop-out voltage is the product of the load current and the  $R_{ds(on)}$  of the internal MOSFET.

## REVERSE CURRENT PATH

The internal MOSFET in the LP2966EP has an inherent parasitic diode. During normal operation, the input voltage is higher than the output voltage and the parasitic diode is reverse biased. However, if the output is pulled above the input in an application, then current flows from the output to the input as the parasitic diode gets forward biased. The output can be pulled above the input as long as the current in the parasitic diode is limited to 150mA.

## MAXIMUM OUTPUT CURRENT CAPABILITY

Each output in the LP2966EP can deliver a current of more than 150mA over the full operating temperature range. However, the maximum output current capability should be derated by the junction temperature. Under all possible conditions, the junction temperature must be within the range specified under operating conditions. The LP2966EP is available in MSOP-8 package. This package has a junction to ambient temperature coefficient ( $\theta_{ja}$ ) of 235  $^{\circ}\text{C}/\text{W}$  with minimum amount of copper area. The total power dissipation of the device is approximately given by:

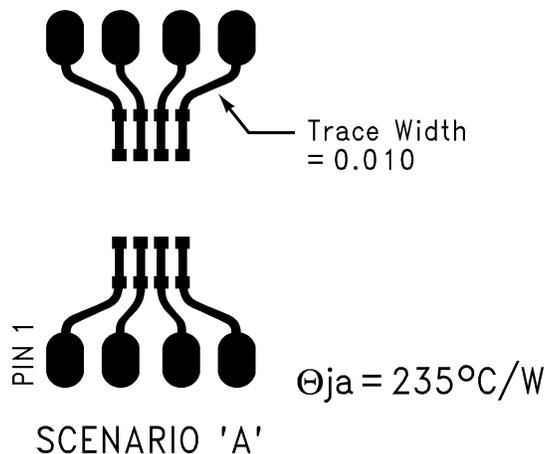

$$P_D = (V_{in} - V_{OUT1})I_{OUT1} + (V_{in} - V_{OUT2})I_{OUT2}$$

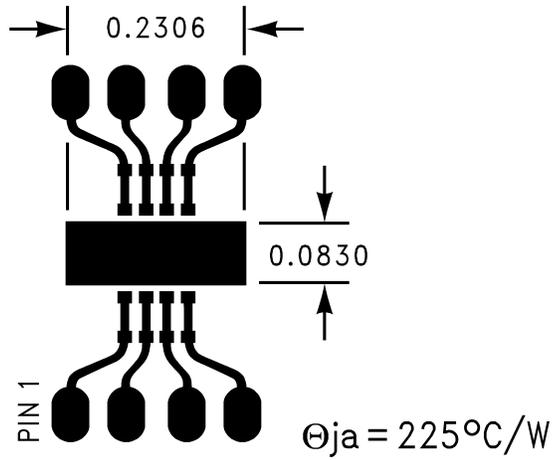

The maximum power dissipation,  $P_{Dmax}$ , that the device can tolerate can be calculated by using the formula

$$P_{Dmax} = (T_{jmax} - T_A)/\theta_{ja}$$

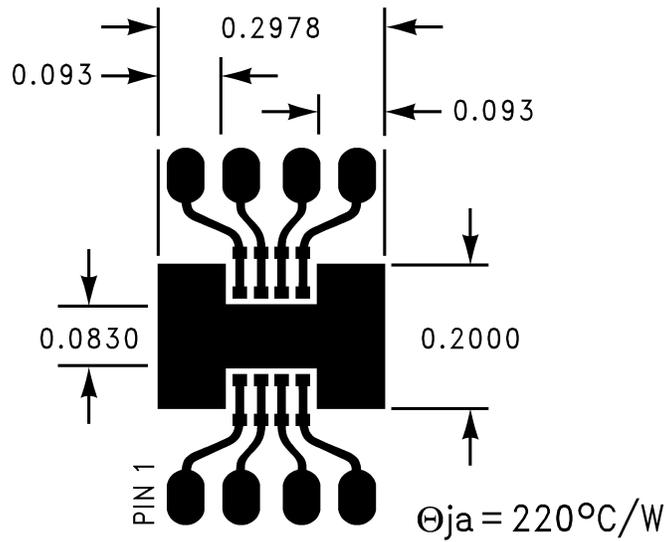

where  $T_{jmax}$  is the maximum specified junction temperature (125 $^{\circ}\text{C}$ ), and  $T_A$  is the ambient temperature.

The following figures show the variation of thermal coefficient with different layout scenarios.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
