

**M51943A,B/M51944A,B****VOLTAGE DETECTING, SYSTEM RESETTING IC SERIES****DESCRIPTION**

M51943A,B/M51944A,B are semiconductor integrated circuits designed for detecting supply voltage and resetting all types of logic circuits such as CPUs.

They find extensive applications, including battery checking circuit, level detecting circuit and waveform shaping circuit.

**FEATURES**

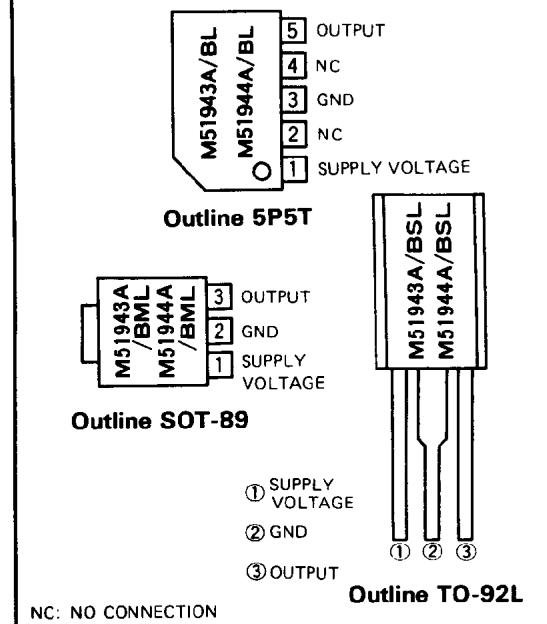

- Few external parts
- Low threshold operating voltage (Supply voltage to keep low-state at low supply voltage) . . . . . 0.6V (TYP.) at  $R_L = 22\text{k}\Omega$
- Wide supply voltage range . . . . . 2 ~ 17V
- Sudden change in power supply has minimal effect on the ICs
- Wide application range
- SIL package of the same height as DIP (5-pin SIP)
- Extra small 3-pin package (3-pin FALT)

**APPLICATION**

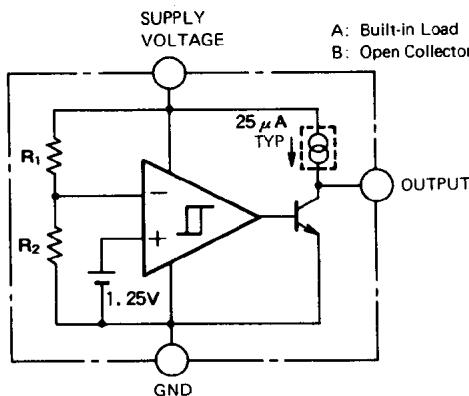

Reset circuit of Pch, Nch, CMOS, microcomputer, CPU and microcomputer, Reset of logic circuit, Battery check circuit, Switching circuit back-up voltage, Level detecting circuit, Waveform shaping circuit, Delay waveform generating circuit, DC-DC converter, Over voltage protection circuit.

**RECOMMENDED OPERATING CONDITION**

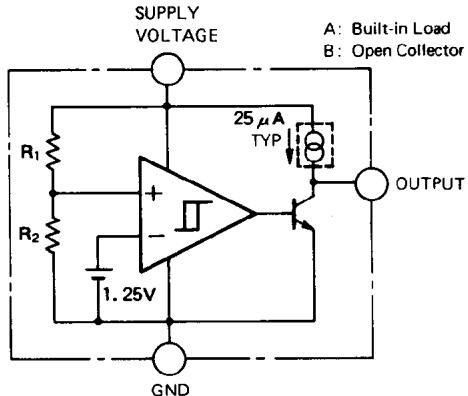

Supply voltage range . . . . . 2 ~ 17V

**ABSOLUTE MAXIMUM RATINGS** ( $T_a = 25^\circ\text{C}$ , unless otherwise noted)

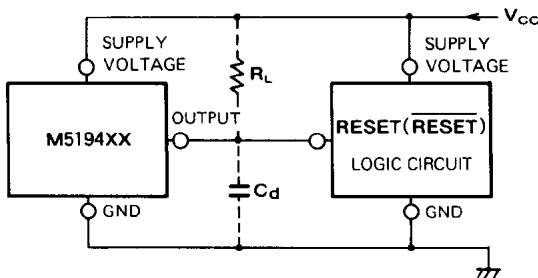

Symbol	Parameter	Conditions	Ratings	Unit
$V_{CC}$	Supply voltage		18	V
$I_{sink}$	Output Sink Current		6	mA
$V_O$	Output voltage	A Type (Output with constant current load)	$V_{CC}$	V
		B Type (Open collector output)	18	
$P_d$	Power dissipation	5P SIL	450	mW
		3P SIL	700	
		3P FLAT	500	
$K_\theta$	Thermal Derating	$T_a \geq 25^\circ\text{C}$	5P SIL	mW/°C
			3P SIL	
			3P FLAT	
$T_{opr}$	Operating temperature		-30 ~ +85	°C
$T_{stg}$	Storage temperature		-40 ~ +125	°C

**ELECTRICAL CHARACTERISTICS** ( $T_a = 25^\circ\text{C}$ , unless otherwise noted)

"L" reset type	"H" reset type
<b>M51943A</b>	<b>M51944A</b>

**VOLTAGE DETECTING, SYSTEM RESETTING IC SERIES****EXAMPLE OF APPLICATION CIRCUIT****Reset Circuit of M5194XX Series**

Note 1. When the detecting supply voltage is 4.25V, M51943 and M51944 are used. When the voltage is anything except 4.25V, M51945 and M51946 are used.

Note 2. If the M5194XX and the logic circuit share a common power source, type A (built-in load type) can be used whether a pull-up resistor is included in the logic circuit or not.

Note 3. The logic circuit preferably should not have a pull-down resistor, but if one is present, add load resistor  $R_L$  to overcome the pull-down resistor.

Note 4. It is better to use the M5195XX series to cause a delay, but if the delay is caused by the M5194XX series, the delay capacitor Cd is applied between the output and GND.

Note 5. When the reset terminal in the logic circuit is of the low reset type, M51943 and M51945 are used and when the terminal is of the high reset type, M51944 and M51946 are used.

Note 6. When a negative supply voltage is used, the supply voltage side of M5194XX and the GND side are connected to GND and the negative supply voltage respectively.
