

VARIABLE OUTPUT VOLTAGE REGULATOR**DESCRIPTION**

The M5231TL is a semiconductor integrated circuit which is designed for variable output voltage regulator and is housed in a small 5-pin SIP.

The input range 8~70V, and the output voltage range 3~50V can be optionally adjusted by the external resistors. In addition, by attaching power transistors, high current gains can be achieved, making the device suitable for used in the power supplies of a wide variety of equipment.

FEATURES

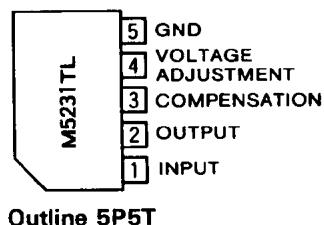

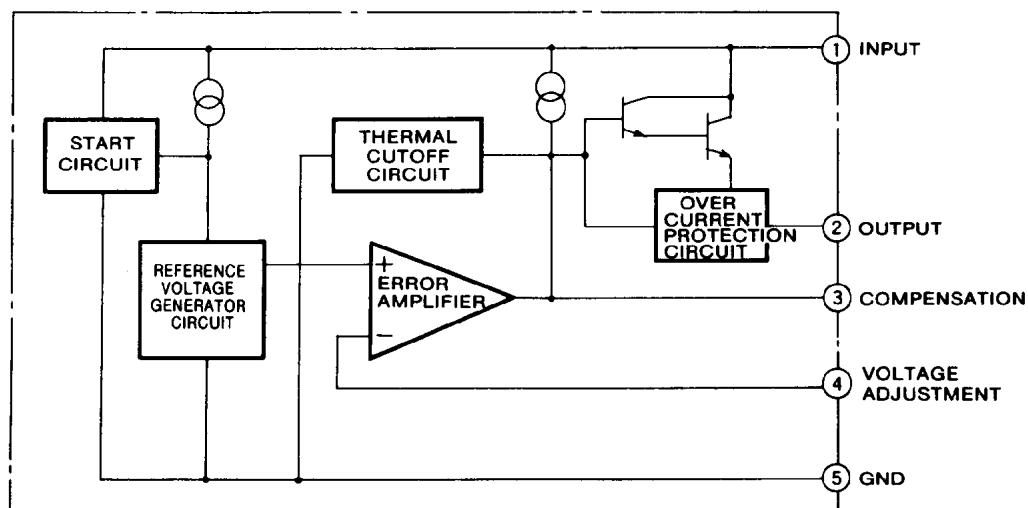

- High input voltage $V_i = 70V$
- Wide range of output voltages $V_o = 3V \sim 50V$
- Low output noise voltage $V_{NO} = 6\mu V_{rms}$ (typ.)
- Built-in current limiting and thermal shutdown circuits
- Capability of adjusting the output voltage rise time constant of the coefficients by the external capacitor
- Capability of the operating control by the external signal

APPLICATION

Audio, VTR equipment, and a variety of electronic musical instruments.

TEST CIRCUITS**(a) Standard test circuit**

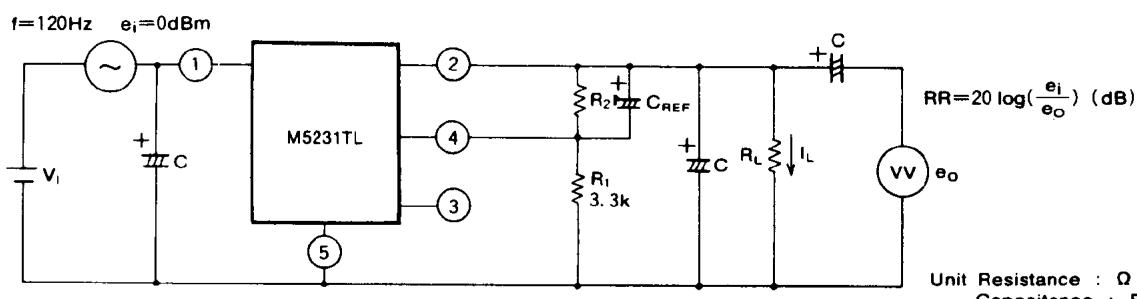

$$V_o = V_{REF}(1 + \frac{R_2}{R_1}) \approx 1.8 \times (1 + \frac{R_2}{3.3}) \quad (\text{V})$$

$$R_2 = R_1(\frac{V_o}{V_{REF}} - 1) \approx 3.3 \times (\frac{V_o}{1.8} - 1) \quad (\text{k}\Omega)$$

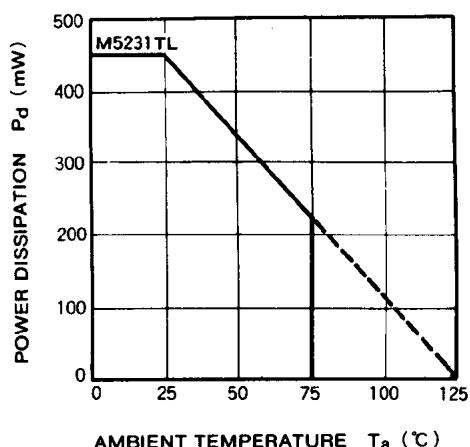

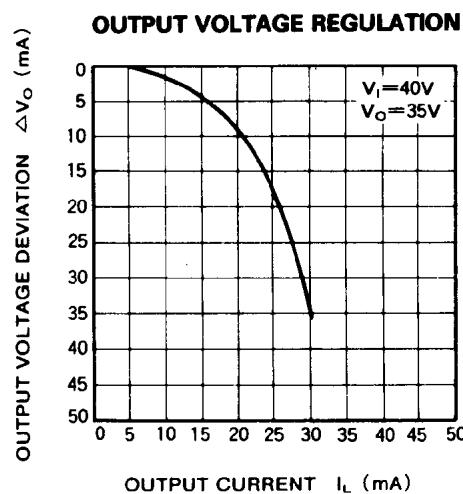

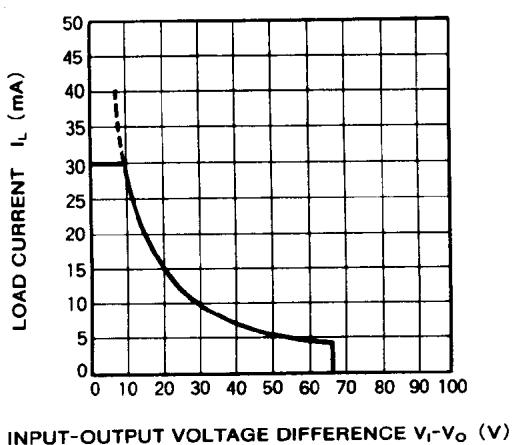

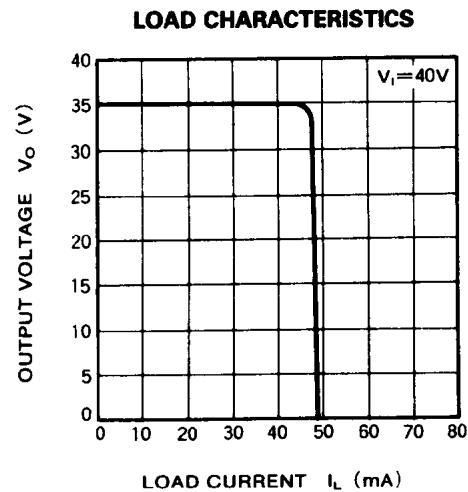

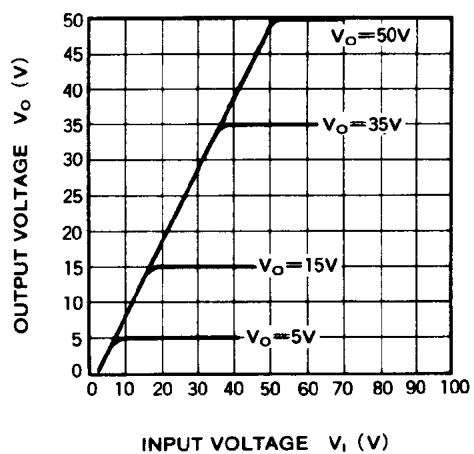

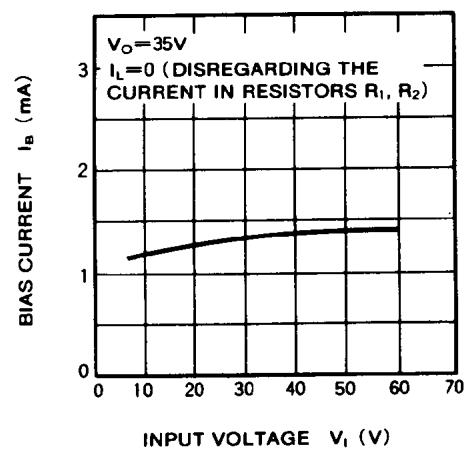

$$R_1 = 3.3\text{k}\Omega, V_{REF} = 1.8\text{V}$$

VARIABLE OUTPUT VOLTAGE REGULATOR**APPLICATION EXAMPLES****(1) Standard application example****C_{REF}**

Connection of this capacitor gives the following characteristics.

- 1) The rise time of the output voltage can be adjusted (slowed).
- 2) The ripple rejection ratio is improved.
- 3) Output noise voltage is reduced down to 1/10 of three terminal regulator IC.

(2) Current boost circuit with NPN external power TR**EXAMPLE 1 OF CHARACTERISTIC ACHIEVED****OUTPUT VOLTAGE CHARACTERISTICS FOR EXTERNAL CAPACITORS (C_{REF})****(3) Supper low dropout regulator circuits (V_{IO}=100mW)**

- Stable operation is expected even if the input-output voltage differences are as low as 0.1V.

The heat sink of power TR can become small in size owing to low dissipation. The R_3 is a load current limit resistor and the input-output voltage differences between ① and ② pins must be over 3V. $V_i - V_{RE} - (I_1 + I_2 - I_B)R_3 > 3\text{V}$

VARIABLE OUTPUT VOLTAGE REGULATOR**(4) Output voltage ON/OFF controller, Step UP/DOWN controller**

- The output voltage V_o is 0V when the RT₁ of ③ pin is ON. Therefore, the power can be on/off depending on each case.
- The output voltage is changeable by switching the RT₂.
- Resistor of 1kΩ must be connected for R₄ to protect the integrated circuit.

(Note) The load current can be over 1A by connection the external power TR.
