

DESCRIPTION

The M52760SP is IF signal-processing IC for VCRs and TVs. It enable the PLL detection system despite size as small as that of conventional quasi-synchronous VIF/SIF detector, IF/RF AGC, SIF limiter, FM detector and EQ AMP.

FEATURES

- Video detection output is 2VP-P. It has built-in EQ AMP.
- The package is a 20-pin shrink-DIP, suitable for space saving.
- The video detector uses PLL for full synchronous detection circuit. It produces excellent characteristics of DG, DP, 920kHz beat, and cross color.
- Dynamic AGC realizes high speed response with only single filter.
- Video IF and sound IF signal processings are separated from each other. VCO output is used to obtain intercarrier. This PLL-SPLIT method provide good sound sensitivity and reduces buzz.
- As AFT output voltage uses the APC output voltage, VCO coil is not used.
- Audio FM demodulation uses PLL system, so it has wide frequency range with no external parts and no adjustment.
- QIF AMP has a fixed gain, and good characteristic for NICAM.

APPLICATION

TV sets, VCR tuners

RECOMMENDED OPERATING CONDITION

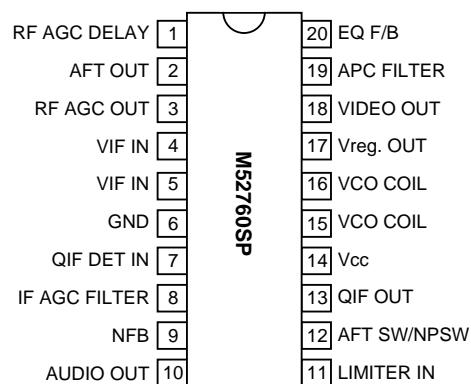

In case of Vcc and Vreg. out short

Supply voltage range.....4.75 to 5.25V

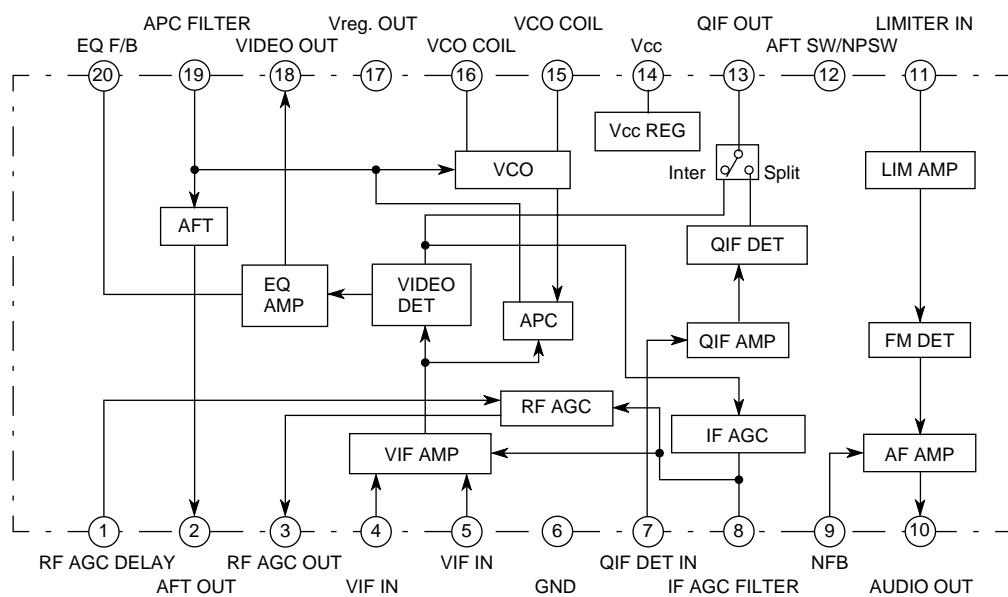

Recommended supply voltage.....5.0V

In case of Vreg. out open

Supply voltage range.....8.5 to 12.5V

PIN CONFIGURATION (TOP VIEW)

Outline 20P4B

0 to 2.3	0 to 0.6	PAL	NORMAL
	1.0 to 2.3		DEFEAT
2.7 to 5.0	2.7 to 4.0	NTSC	NORMAL
	4.4 to 5.0		DEFEAT

ELECTRICAL CHARACTERISTICS TEST METHOD

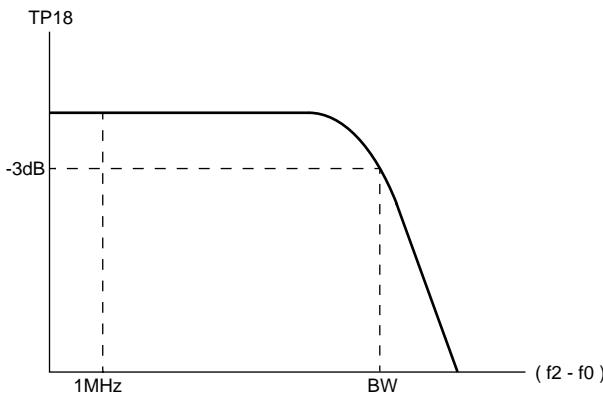

Video S/N

Input SG2 into VIF IN and measure the video out (Pin 18) noise in r.m.s at TP18B through a 5MHz (-3dB) L.P.F.

$$S/N = 20 \log \left(\frac{0.7 \times V_o \text{ det}}{\text{NOISE}} \right) (\text{dB})$$

BW Video band width

1. Measure the 1MHz component level of EQ output TP18A with a spectrum analyzer when SG3 ($f_2=57.75\text{MHz}$) is input into VIF IN. At that time, measure the voltage at TP8 with SW8, set to position 2, and then fix V8 at that voltage.
2. Reduce F2 and measure the value of (f_2-f_0) when the (f_2-f_0) component level reaches -3dB from the 1MHz component level as shown below.

VIN MIN Input sensitivity

Input SG4 ($V_i=90\text{dB}\mu$) into VIF IN, and then gradually reduce V_i and measure the input level when the 20kHz component of EQ output TP18A reaches -3dB from $V_o \text{ det}$ level.

VIN MAX Maximum allowable input

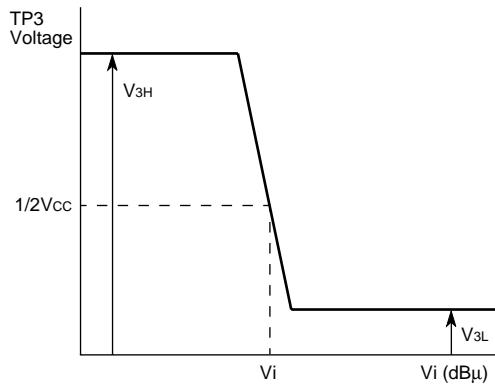

1. Input SG5 ($V_i=90\text{dB}\mu$) into VIF IN, and measure the level of the 20kHz component of EQ output.
2. Gradually increase the V_i of SG and measure the input level when the output reaches -3dB.

GR AGC control range

$$GR = VIN \text{ MAX} - VIN \text{ MIN} (\text{dB})$$

V3 RF AGC operating voltage

Input SG8 into VIF IN, and gradually reduce V_i and then measure the input level when RF AGC output TP3 reaches $1/2 \text{Vcc}$, as shown below.

CL-U Capture range

1. Increase the frequency of SG9 until the VCO is out of locked-oscillation.
 2. Decrease the frequency of SG9 and measure the frequency f_U when the VCO locks.
- $CL-U = f_U - 58.75 \text{ (MHz)}$

CL-L Capture range

1. Decrease the frequency of SG9 until the VCO is out of locked-oscillation.
 2. Increase the frequency of SG9 and measure the frequency f_L when the VCO locks.
- $CL-L = 58.75 - f_L \text{ (MHz)}$

CL-T Capture range

$$CL-T = CL-U + CL-L \text{ (MHz)}$$

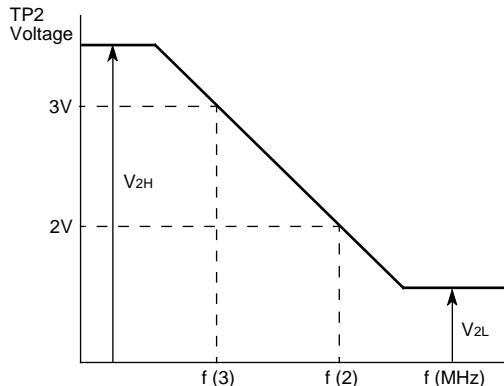

VCO Δf VCO SW on drift

1. Input SG2 into VIF IN .
2. Adjust the VCO coil so that AFT voltage can be reached to $1/2 \text{Vcc}$ in 10 seconds after the power switch is turned to on.
3. If AGC FILTER (Pin8) is connected to GND (0V) after turning off the VIF input.
4. And then, measure each free running frequencies of 10 and 60 seconds later.

$$\begin{aligned} VCO \Delta f (\text{kHz}) &= \text{frequency2 (60 sec. later)} \\ &\quad - \text{frequency1 (10 sec. later)} \end{aligned}$$

μ AFT sensitivity, V_{2H} Maximum AFT voltage, V_{2L} Minimum AFT voltage

1. Input SG10 into VIF IN, and set the frequency of SG10 so that the voltage of AFT output TP2 is 3V. This frequency is $f(3)$.
2. Set the frequency of SG10 so that the AFT output voltage is 2V. This frequency is $f(2)$
3. IN the graph, maximum and minimum DC voltage are V_{2H} and V_{2L} , respectively.

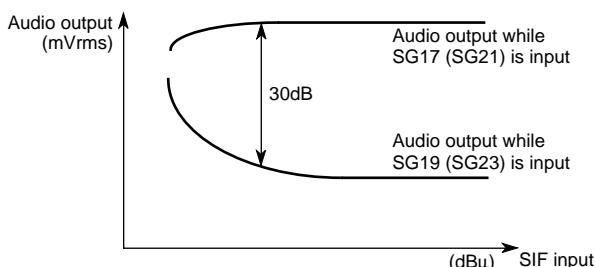

$$\mu = \frac{1000 \text{ (mV)}}{f(2) - f(3) \text{ (kHz)}} \text{ (mV/kHz)}$$

IM Intermodulation

1. Input SG11 into VIF IN, and measure EQ output TP18A with an oscilloscope.
 2. Adjust AGC filter voltage V8 so that the minimum DC level of the output waveform is 1.0V.
 3. At this time, measure, TP18A with a spectrum analyzer.
- The intermodulation is defined as a difference between 1.07MHz and 4.43MHz frequency components.

LIM Limiting sensitivity

1. Input SG17 (SG21) into SIF input, and measure the 400Hz component level of AF output TP10.
2. Input SG19 (SG23) into SIF input, and measure the 400Hz component level of AF output TP10.
3. The input limiting sensitivity is defined as the input level when a difference between each 400Hz components of audio output (TP10) is 30dB, as shown below.

AMR AM Rejection

1. Input SG18 into SIF input, and measure the output level of AF output TP10. This level is VAM.
2. AMR is;

$$\text{AMR} = 20 \log \left(\frac{V_{\text{OAF}} \text{ (mVr.m.s)}}{V_{\text{AM}} \text{ (mVr.m.s)}} \right) \text{ (dB)}$$

AF S/N

1. Input SG19 into SIF input, and measure the output noise level of AF output TP1. This level is VN.
2. S/N is;

$$\text{S/N} = 20 \log \left(\frac{V_{\text{OAF}} \text{ (mVr.m.s)}}{V_{\text{N}} \text{ (mVr.m.s)}} \right) \text{ (dB)}$$

CQIF QIF control

Lower the voltage of V7, and measure the voltage of V7 when the DC voltage of TP13 begins to change.

THE NOTE IN THE SYSTEM SETUP

M52760SP has 2 power supply pins of Vcc (pin 14) and Vreg.OUT (pin 17).

Pin 14 is for AFT output, RF AGC output circuits and 5V regulated power supply circuit and Pin 17 is for the other circuit blocks.

In case M52760SP is used together with other ICs like VIF operating at more than 5V, the same supply voltage as that of connected ICs is applied to Vcc and Vreg.OUT is opened. The other circuit blocks, connected to Vreg.OUT are powered by internal 5V regulated power supply.

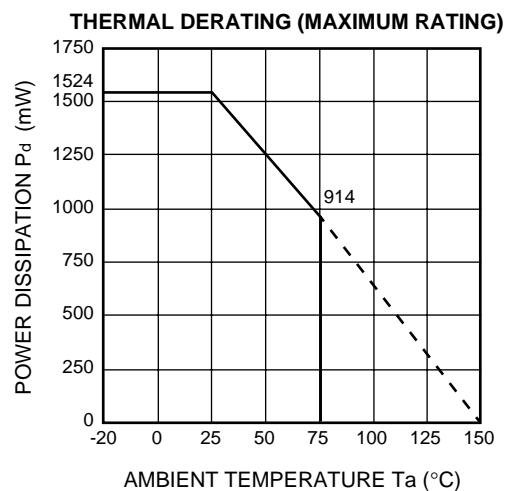

In case the connecting ICs are operated at 5V, 5V is supplied to both Vcc and Vreg.OUT.
