3.3 V / 5 V ECL Differential **Data and Clock D Flip-Flop**

Description

The MC10EP/100EP52 is a differential data, differential clock D flip-flop. The device is pin and functionally equivalent to the EL52 device.

Data enters the master portion of the flip-flop when the clock is LOW and is transferred to the slave, and thus the outputs, upon a positive transition of the clock. The differential clock inputs of the EP52 allow the device to also be used as a negative edge triggered device.

The EP52 employs input clamping circuitry so that under open input conditions (pulled down to V_{EE}) the outputs of the device will remain stable.

The 100 Series contains temperature compensation.
