3.3V 1:6 LVCMOS PLL Clock Generator

The MPC9330 is a 3.3V compatible, 1:6 PLL based clock generator targeted for high performance low-skew clock distribution in mid-range to high-performance telecomm, networking and computing applications. With output frequencies up to 120 MHz and output skews less than 150ps the device meets the needs of the most demanding clock applications. The MPC9330 is specified for the temperature range of 0°C to +70°C.

Features

- 1:6 PLL based low-voltage clock generator
- 3.3V power supply
- Generates clock signals up to 120 MHz
- Maximum output skew of 150 ps
- On-chip crystal oscillator clock reference
- Alternative LVCMOS PLL reference clock input
- Internal and external PLL feedback
- PLL multiplies the reference clock by 4x, 3x, 2x, 1x, 4/3x, 3/2x, 2/3x, x/2, x/3 or x/4
- · Supports zero-delay operation in external feedback mode
- Synchronous output clock stop in logic low eliminates output runt pulses
- Power_down feature reduces output clock frequency
- Drives up to 12 clock lines
- 32 lead LQFP packaging
- Ambient temperature range 0°C to +70°C
- Internal Power–Up Reset
- Pin and function compatible to the MPC930

Functional Description

The MPC9330 utilizes PLL technology to frequency lock its outputs onto an input reference clock. Normal operation of the MPC9330 requires either the selection of internal PLL feedback or the connection of one of the device outputs to the feedback input to close the PLL feedback path in external feedback mode. The reference clock frequency and the divider for the feedback path determine the VCO frequency. Both must be selected to match the VCO frequency range. In external PLL feedback configuration and with the available post-PLL dividers (divide-by-2, divide-by-4 and divide-by-6), the internal VCO of the MPC9330 is running at either 4x, 8x, 12x, 16x or 24x of the reference clock frequency. In internal feedback configuration (divide-by-16) the internal VCO is running 16x of the reference frequency. The frequency of the QA, QB, QC output banks is a division of the VCO frequency and can be configured independently for each output bank using the FSELA, FSELB and FSELC pins, respectively. The available output to input frequency ratios are 4x, 3x, 2x, 1x, 4/3x, 3/2x, 2/3x, x/2, x/3 or x/4.

The REF_SEL pin selects the internal crystal oscillator or the LVCMOS compatible input as the reference clock signal. The PLL_EN control selects the PLL bypass configuration for test and diagnosis. In this configuration, the selected input reference clock is routed directly to the output dividers bypassing the PLL. The PLL bypass is fully static and the minimum clock frequency specification and all other PLL characteristics do not apply.

The outputs can be disabled (high-impedance) by deasserting the OE/MR pin. In the PLL configuration with external feedback selected, deasserting OE/MR causes the PLL to loose lock due to missing feedback signal presence at FB_IN. Asserting OE/MR will enable the outputs and close the phase locked loop, enabling the PLL to recover to normal operation. The MPC9330 output clock stop control allows the outputs to start and stop synchronously in the logic low state, without the potential generation of runt pulses.

The MPC9330 is fully 3.3V compatible and requires no external loop filter components. All inputs (except XTAL) accept LVCMOS signals while the outputs provide LVCMOS compatible levels with the capability to drive terminated 50 Ω transmission lines. For series terminated transmission lines, each of the MPC9330 outputs can drive one or two traces giving the devices an effective fanout of 1:12. The device is packaged in a 7x7 mm² 32-lead LQFP package.

CASE 873A

MPC9330

It is recommended to use an external RC filter for the analog power supply pin VCC_PLL. Please see application section for details.

Figure 2. MPC9330 32–Lead Package Pinout (Top View)

Table 1: PIN CONFIGURATION

Pin	I/O	Туре	Function
CCLK	Input	LVCMOS	PLL reference clock signal
XTAL_IN, XTAL_OUT	Input	Analog	Crystal oscillator interface
FB_IN	Input	LVCMOS	PLL feedback signal input, connect to an output
FB_SEL	Input	LVCMOS	Feedback select
REF_SEL	Input	LVCMOS	Reference clock select
PWR_DN	Input	LVCMOS	Output frequency and power down select
FSELA	Input	LVCMOS	Frequency divider select for bank A outputs
FSELB	Input	LVCMOS	Frequency divider select for bank B outputs
FSELC	Input	LVCMOS	Frequency divider select for bank C outputs
PLL_EN	Input	LVCMOS	PLL enable/disable
CLK_STOP0-1	Input	LVCMOS	Clock output enable/disable
OE/MR	Input	LVCMOS	Output enable/disable (high-impedance tristate) and device reset
QA0-1, QB0-1, QC0-1	Output	LVCMOS	Clock outputs
GND	Supply	Ground	Negative power supply
VCC_PLL	Supply	VCC	PLL positive power supply (analog power supply). It is recommended to use an external RC filter for the analog power supply pin V_{CC_PLL} . Please see applications section for details.
VCC	Supply	VCC	Positive power supply for I/O and core. All VCC pins must be connected to the positive power supply for correct operation

Table 2: FUNCTION TABLE

Control	Default	0	1						
REF_SEL	0	The crystal oscillator output is the PLL reference clock	CCLK is the PLL reference clock						
FB_SEL	0	Internal PLL feedback of 16. f _{VCO} = 16 * f _{ref}	External feedback. Zero-delay operation enabled for CCLK as reference clock						
PLL_EN	1	Test mode with PLL disabled. The reference clock is substituted for the internal VCO output. MPC9330 is fully static and no minimum frequency limit applies. All PLL related AC characteristics are not applicable.	Normal operation mode with PLL enabled.						
PWR_DN	1	VCO ÷ 2 (High output frequency range)	VCO ÷ 4 (Low output frequency range)						
FSELA	0	Output divider ÷ 2	Output divider ÷ 4						
FSELB	0	Output divider ÷ 2	Output divider ÷ 4						
FSELC	0	Output divider ÷ 4	Output divider ÷ 6						
CLK_STOP[0:1]	11	See Table 3							
OE/MR 1 Outputs disabled (high-impedance state) and reset of the device. During reset in external feedback configuration, the PLL feedback loop is open. The VCO is tied to its lowest frequency. The MPC9330 requires reset after any loss of PLL lock. Loss of PLL lock may occur when the external feedback path is interrupted. The length of the reset pulse should be greater than one reference clock cycle (CCLK). Reset does not affect PLL lock in internal feedback configuration. Outputs enabled (active)									
PWR_I	PWR_DN, FSELA, FSELB and FSELC control the operating PLL frequency range and input/output frequency ratios. See Tables 10–12 for supported frequency ranges and output to input frequency ratios.								

CLK_STOP0	CLK_STOP1	QA[0:1]	QB[0:1]	QC[0:1]	
0	0	Active	Stopped in logic L state	Stopped in logic L state	
0	1	Active	Stopped in logic L state	Active	
1	0	Stopped in logic L state	Stopped in logic L state	Active	
1	1	Active	Active	Active	

a. Output operation for OE/MR=1 (outputs enabled). OE/MR=0 will disable (high-impedance state) all outputs independend on CLK_STOP[0:1]

Table 4: GENERAL SPECIFICATIONS

Symbol	Characteristics	Min	Тур	Max	Unit	Condition
V _{TT}	Output Termination Voltage		V _{CC} ÷ 2		V

Table 7: AC CHARACTERISTICS (V_{CC} = 3.3V \pm 5%, T_A = 0°C to 70°C)a

a. AC characteristics apply for parallel output termination of 50Ω to V_{TT}.

b. PLL mode requires PLL_EN = 0 to enable the PLL.

c. +4 feedback (FB) can be accomplished by setting PWR_DN = 0 and the connection of one +2 output to FB_IN. See Table 1 to Table 3 for other feedback configurations.

d. In bypass mode, the MPC9330 divides the input reference clock.

e. The input frequency fref on CCLK must match the VCO frequency range divided by the feedback divider ratio FB: fref = fVCO ÷ FB.

f. The usable crystal frequency range depends on the VCO lock frequency and the PLL feedback ratio.

g. SPO is the static phase offset between CCLK and FB_IN (FB_SEL=1 and PLL locked). $t_{sk(0)}$ [ps] = $t_{sk(0)}$ [°] ÷ (fref • 360°)

h. Skew data applicable for equally loaded outputs only.

i. -3 dB point of PLL transfer characteristics.

MPC9330

APPLICATIONS INFORMATION

Programming the MPC9330

The MPC9330 supports output clock frequencies from 8.33 to 120 MHz. Different feedback and output divider configurations can be used to achieve the desired input to output frequency relationship. The feedback frequency and divider should be used to situate the VCO in the frequency lock range between 200 and 480 MHz for stable and optimal

operation. The FSELA, FSELB, FSELC and PWR_DN pins select the desired output clock frequencies. Possible frequency ratios of the reference clock input to the outputs are 1:4, 1:3, 1:2, 1:1, 2:3, 4:3 and 3:2. Tables 10 through 12 illustrate the various output configurations and frequency ratios supported by the MPC9330.

APPLICATIONS INFORMATION

Power Supply Filtering

The MPC9330 is a mixed analog/digital product. Its analog circuitry is naturally susceptible to random noise, especially if this noise is seen on the power supply pins. Random noise on the V_{CC} PLL power supply impacts the device characteristics, for instance I/O jitter. The MPC9330 provides separate power supplies for the output buffers (VCC) and the phase-locked loop (V_{CC_PLL}) of the device. The purpose of this design technique is to isolate the high switching noise digital outputs from the relatively sensitive internal analog phase-locked loop. In a digital system environment where it is more difficult to minimize noise on the power supplies a second level of isolation may be required. The simple but effective form of isolation is a power supply filter on the VCC PLL pin for the MPC9330. Figure 3. illustrates a typical power supply filter scheme. The MPC9330 frequency and phase stability is most susceptible to noise with spectral content in the 100kHz to 20MHz range. Therefore the filter should be designed to target this range. The key parameter that needs to be met in the final filter design is the DC voltage drop across the series filter resistor RF. From the data sheet theICC PLI current(thecurrentsourcedthroughtheVCC PLI pin) is typically 5 mA (10 mA maximum), assuming that a minimum of 2.985V must be maintained on the VCC PLL pin. The resistor RF shown in Figure 3. "VCC PLL Power Supply Filter" should have a resistance of 10–15 Ω to meet the voltage drop criteria.

Figure 3. VCC PLL Power Supply Filter

The minimum values for R_F and the filter capacitor C_F are defined by the required filter characteristics: the RC filter should provide an attenuation greater than 40 dB for noise whose spectral content is above 100 kHz. In the example RC filter shown in Figure 3. "V_{CC_PLL} Power Supply Filter", the filter cut-off frequency is around 3-5 kHz and the noise attenuation at 100 kHz is better than 42 dB.

As the noise frequency crosses the series resonant point of an individual capacitor its overall impedance begins to look inductive and thus increases with increasing frequency. The parallel capacitor combination shown ensures that a low impedance path to ground exists for frequencies well above the bandwidth of the PLL. Although the MPC9330 has several design features to minimize the susceptibility to power supply noise (isolated power and grounds and fully differential PLL) there still may be applications in which overall performance is being degraded due to system power supply noise. The power supply filter schemes discussed in this section should be adequate to eliminate power supply noise related problems in most designs.

Driving Transmission Lines

The MPC9330 clock driver was designed to drive high speed signals in a terminated transmission line environment. To provide the optimum flexibility to the user the output drivers were designed to exhibit the lowest impedance possible. With an output impedance of less than 20 Ω the drivers can drive either parallel or series terminated transmission lines. For more information on transmission lines the reader is referred to Motorola application note AN1091. In most high performance clock networks point-to-point distribution of signals is the method of choice. In a point-to-point scheme either series terminated or parallel terminated transmission lines the signal at the end of the line with a 50 Ω resistance to V_{CC}+2.

This technique draws a fairly high level of DC current and thus only a single terminated line can be driven by each output of the MPC9330 clock driver. For the series terminated case however there is no DC current draw, thus the outputs can drive multiple series terminated lines. Figure 4. "Single versus Dual Transmission Lines" illustrates an output driving a single series terminated line versus two series terminated lines in parallel. When taken to its extreme the fanout of the MPC9330 clock driver is effectively doubled due to its capability to drive multiple lines.

Figure 4. Single versus Dual Transmission Lines

The waveform plots in Figure 5. "Single versus Dual Line Termination Waveforms" show the simulation results of an output driving a single line versus two lines. In both cases the drive capability of the MPC9330 output buffer is more than sufficient to drive 50Ω transmission lines on the incident edge. Note from the delay measurements in the simulations a delta of only 43ps exists between the two differently loaded outputs. This suggests that the dual line driving need not be used exclusively to maintain the tight output-to-output skew of the MPC9330. The output waveform in Figure 5. "Single versus Dual Line Termination Waveforms" shows a step in the waveform, this step is caused by the impedance mismatch seen looking into the driver. The parallel combination of the 36Ω series resistor plus the output impedance does not match the parallel combination of the line impedances. The voltage wave launched down the two lines will equal:

$$V_{L} = V_{S} (Z_{0} \div (R_{S}+R_{0}+Z_{0}))$$

$$Z_{0} = 50\Omega || 50\Omega$$

$$R_{S} = 36\Omega || 36\Omega$$

$$R_{0} = 14\Omega$$

$$V_{L} = 3.0 (25 \div (18+14+25))$$

$$= 1.31V$$

At the load end the voltage will double, due to the near unity reflection coefficient, to 2.6V. It will then increment towards the quiescent 3.0V in steps separated by one round trip delay (in this case 4.0ns).

Figure 5. Single versus Dual Waveforms

Since this step is well above the threshold region it will not cause any false clock triggering, however designers may be uncomfortable with unwanted reflections on the line. To better match the impedances when driving multiple lines the situation in Figure 6. "Optimized Dual Line Termination" should be used. In this case the series terminating resistors are reduced such that when the parallel combination is added to the output buffer impedance the line impedance is perfectly matched.

Figure 6. Optimized Dual Line Termination

Information in this document is provided solely to enable system and software implementers to use Motorola products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Motorola reserves the right to make changes without further notice to any products herein. Motorola makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Motorola assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Motorola data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Motorola does not convey any license under its patent rights nor the rights of others. Motorola products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Motorola product could create a situation where personal injury or death may occur. Should Buyer purchase or use Motorola products for any such unintended or unauthorized application, Buyer shall indemnify and hold Motorola and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Motorola was negligent regarding the design or manufacture of the part.

MOTOROLA and the Stylized M Logo are registered in the US Patent and Trademark Office. All other product or service names are the property of their respective owners.
