MSM80C88A-10RS/GS/JS

8-BIT CMOS MICROPROCESSOR

GENERAL DESCRIPTION

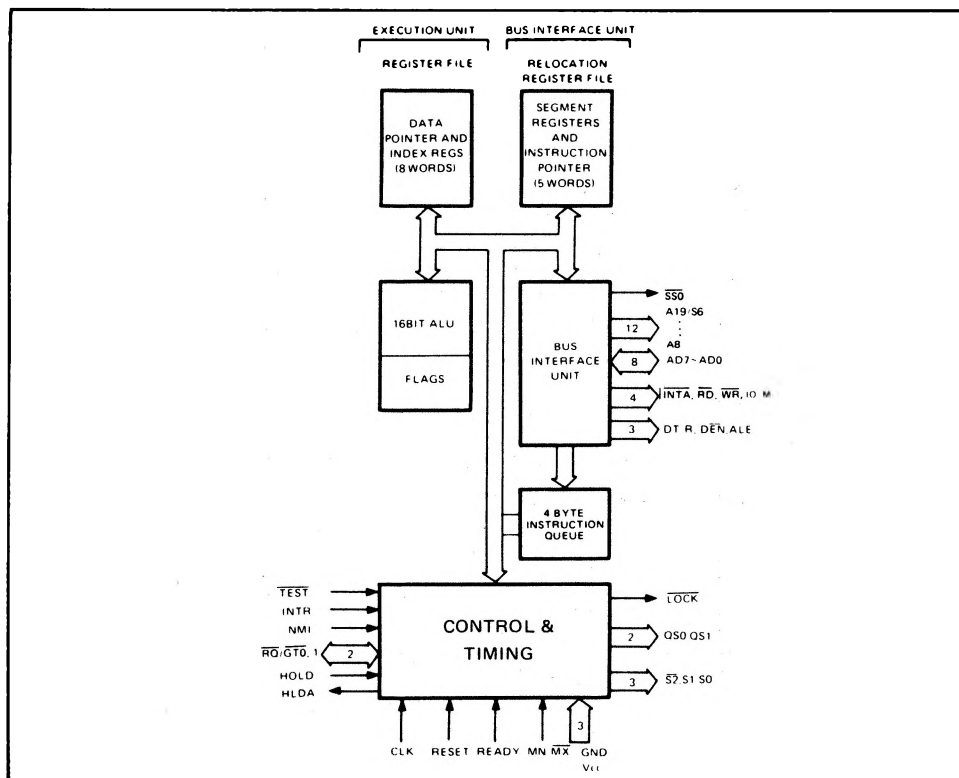

The MSM80C88A-10 are internal 16-bit CPUs with 8-bit interface implemented in Silicon Gate CMOS technology. They are designed with the same processing speed as the NMOS8088-1, but with considerably less power consumption.

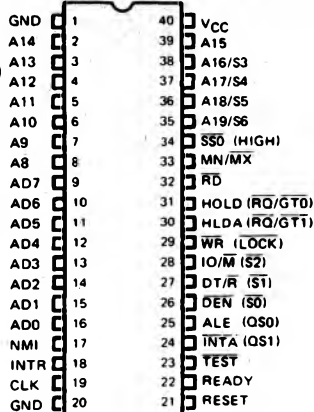

The processor has attributes of both 8 and 16-bit microprocessor. It is directly compatible with MSM80C86A-10 software and MSM80C85A/MSM80C85A-2 hardware and peripherals.

FEATURES

- 8-Bit Data Bus Interface
- 16-Bit Internal Architecture
- 1 Mbyte Direct Addressable Memory Space
- Software Compatible with MSM80C86A
- Internal 14 Word by 16-bit Register Set
- 24 Operand Addressing Modes
- Bit, Byte, Word and String Operations
- 8 and 16-bit Signed and Unsigned Arithmetic Operation
- From DC to 10 MHz Clock Rate
- Low Power Dissipation (10 mA/MHz)
- Bus Hold Circuitry Eliminates Pull-Up Resistors

FUNCTIONAL BLOCK DIAGRAM

The diagram shows the 8085 microprocessor with its 40 pins. The pins are numbered 1 to 40. The functions are as follows:

- Pin 1: N.C.
- Pin 2: A10
- Pin 3: A9
- Pin 4: A8
- Pin 5: A7
- Pin 6: A6
- Pin 7: N.C.
- Pin 8: N.C.
- Pin 9: A5
- Pin 10: A4
- Pin 11: A3
- Pin 12: A2
- Pin 13: A1
- Pin 14: A0
- Pin 15: NMI
- Pin 16: INTR
- Pin 17: CLK
- Pin 18: N.C.
- Pin 19: N.C.
- Pin 20: GND
- Pin 21: VCC
- Pin 22: N.C.
- Pin 23: N.C.
- Pin 24: RESET
- Pin 25: READY
- Pin 26: TEST
- Pin 27: \overline{INTA} (QS1)
- Pin 28: ALE (QS0)
- Pin 29: DEN (S0)
- Pin 30: DT/R (S1)
- Pin 31: $\overline{IO/\overline{M}}$ (S2)
- Pin 32: \overline{WR} (LOCK)
- Pin 33: \overline{HLD} (RQ/GT1)
- Pin 34: N.C.
- Pin 35: N.C.
- Pin 36: N.C.
- Pin 37: HOLD (RQ/GT0)
- Pin 38: \overline{RD}
- Pin 39: MN/ \overline{WT}
- Pin 40: $\overline{SS0}$ (HIGH)
- Pin 41: A19/S6
- Pin 42: N.C.
- Pin 43: A18/S5
- Pin 44: A17/S4
- Pin 45: A16/S3
- Pin 46: A15
- Pin 47: N.C.
- Pin 48: VCC
- Pin 49: VCC
- Pin 50: N.C.
- Pin 51: GND
- Pin 52: N.C.
- Pin 53: A14
- Pin 54: A13
- Pin 55: A12
- Pin 56: A11

MSM80C88A-10JS (Top View)
44 Pin Plastic Leaded Chip Carrier

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Limits			Unit	Conditions
		MSM80C88A-10RS	MSM80C88A-10GS	MSM80C88A-10JS		
Power Supply Voltage	V_{CC}	$-0.5 \sim +7$			V	With respect to GND

 4. Applies only to T3 and wait states.

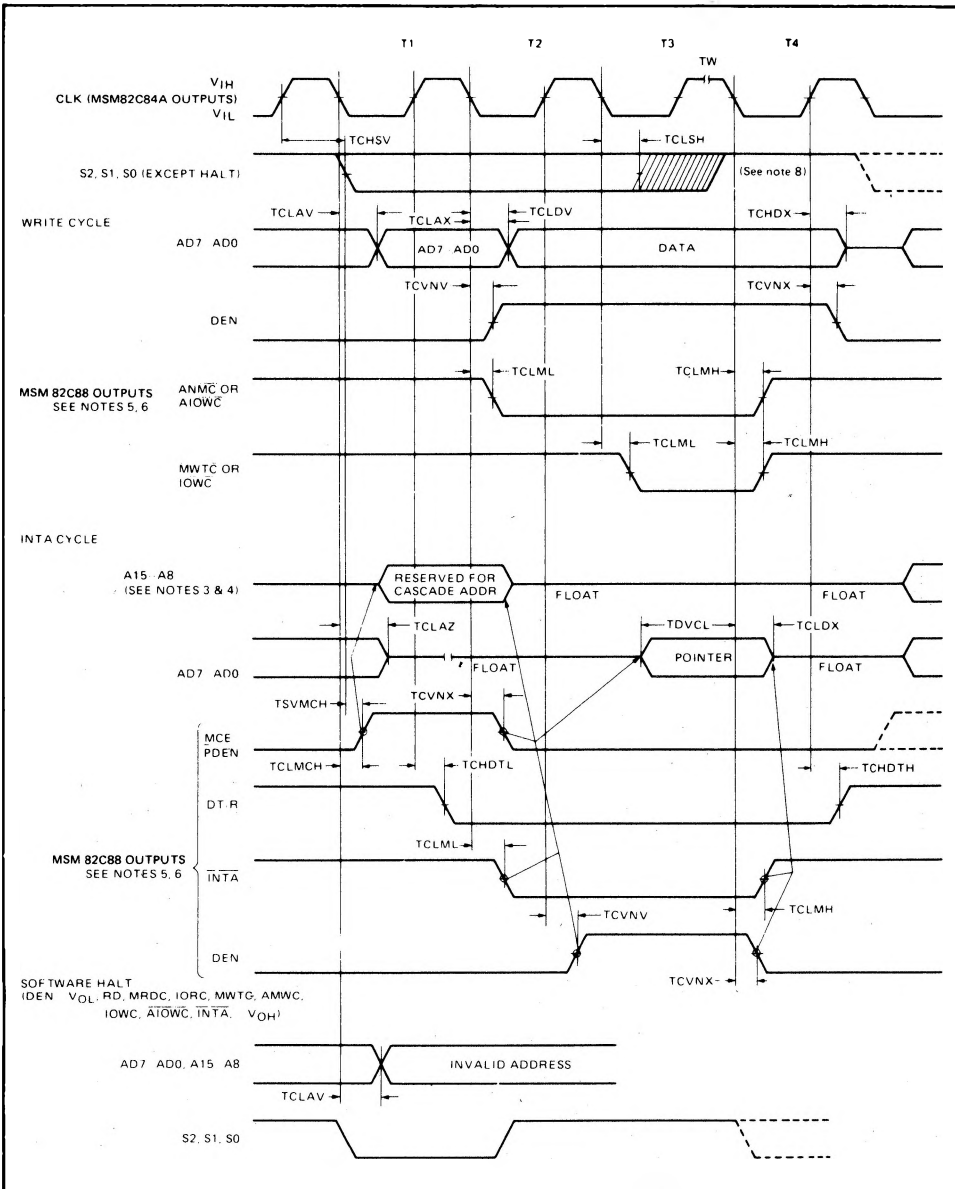

- ### Minimum Mode (Continued)

Maximum Mode

Maximum Mode (Continued)

NOTES:

- 1 All signals switch between V_{OH} and V_{OL} unless otherwise specified
- 2 RDY is sampled near the end of T2, T3, TW to determine if TW machines states are to be inserted.
- 3 Cascade address is valid between first and second INTA cycle
- 4 Two INTA cycles run back to back. The **MSM 80C88A** LOCAL ADDR/DATA BUS is floating during both INTA cycles
Control for pointer address is shown for second INTA cycle
- 5 Signal at **MSM 82C84A** and **MSM82C88** shown for reference only.
- 6 The issuance of the **MSM 82C88** command and control signals IMRDC, MWTC, AMWC, IORC, IOWC, A10WC, INTA and DEN) lags the active high **MSM 82C88** CEN
- 7 All timing measurements are made at 1.5V unless otherwise noted
- 8 Status inactive in state just prior to T4

PIN DESCRIPTION

AD0-AD7

ADDRESS DATA BUS: Input/Output

These lines are the multiplexed address and data bus.

These are the address bus at T1 cycle and the data bus at T2, T3, TW and T4 cycle.

T2, T3, TW and T4 cycle.

These lines are high impedance during interrupt acknowledge and hold acknowledge.

A8-A15

ADDRESS BUS: Output

These lines are the address bus bits 8 thru 15 at all cycles.

These lines do not have to be latched by an ALE signal.

These lines are high impedance during interrupt acknowledge and hold acknowledge.

A16/S3, A17/S4, A18/S5, A19/S6

ADDRESS/STATUS: Output

These are the four most significant address as at the T1 cycle.

Accessing I/O port address, these are low at T1 Cycles.

These lines are Status lines at the T2, T3, TW and T4 Cycle.

S5 indicate interrupt enable Flag.

S3 and S4 are encoded as shown.

S3	S4	Characteristics
0	0	Alternate Data
1	0	Stack
0	1	Code or None
1	1	Data

These lines are high impedance during hold acknowledge.

RD

READ: Output

This lines indicates that the CPU is in a memory or I/O read cycle.

This line is the read strobe signal when the CPU reads data from a memory or I/O device.

This line is active low.

This line is high impedance during hold acknowledge.

READY

READY: Input

This line indicates to the CPU that an addressed memory or I/O device is ready to read or write.

This line is active high.

IF the setup and hold time are outof specification, an illegal operation will occur.

INTR

INTERRUPT REQUEST: Input

This line is a level triggered interrupt request signal which is sampled during the last clock cycle of instruction and string manipulations.

It can be internally masked by software.

This signal is active high and internally synchronized.

TEST

TEST: Input

This line is examined by a "WAIT" instruction.

When TEST is high, the CPU enters an idle cycle.

When TEST is low, the CPU exits an idle cycle.

NMI

NON MASKABLE INTERRUPT: Input

This line causes a type 2 interrupt.

NMI is not maskable.

This signal is internally synchronized and needs a 2 clock cycle pulse width.

RESET

RESET: Input

This signal causes the CPU to initialize immediately.

This signal is active high and must be at least four clock cycles.

CLK

CLOCK: Input

This signal provide the basic timing for an internal circuit.

MN/MX

MINIMUM/MAXIMUM: Input

This signal selects the CPU's operate mode.

When VCC is connected, the CPU operates in minimum mode.

When GND is connected, the CPU operates in maximum mode.

VCC

VCC +5V supplied.

GND

GROUND

The following pin function descriptions are for maximum mode only.

Other pin functions are already described.

S0, S1, S2

STATUS: Output

These lines indicate bus status and they are used by the MSM82C88 Bus Controller to generate all memory and I/O access control signals.

These lines are high impedance during hold acknowledge.

These status lines are encoded as shown.

S2	S1	S0	Characteristics
0 (LOW)	0	0	Interrupt acknowledge
0	0	1	Read I/O Port
0	1	0	Write I/O Port
0	1	1	Halt
1 (HIGH)	0	0	Code Access
1	0	1	Read Memory
1	1	0	Write Memory
1	1	1	Passive

RQ/GT0

RQ/GT1

REQUEST/GRANT: Input/Output

These lines are used for Bus Request from other devices and Bus GRANT to other devices.

These lines are bidirectional and active low.

LOCK

LOCK: Output

This line is active low.

When this line is low, other devices can not gain control of the bus.

This line is high impedance during hold acknowledge.

QS0/QS1

QUEUE STATUS: Output

These are Queue Status Lines that indicate internal instruction queue status.

QS1	QS0	Characteristics
0 (LOW)	0	No Operation
0	1	First Byte of Op Code from Queue
1 (HIGH)	0	Empty the Queue
1	1	Subsequent Byte from Queue

The following pin function descriptions are minimum mode only. Other pin functions are already described.

IO/M

STATUS: Output

This line selects memory address space or I/O address space.

When this line is low, the CPU selects memory address space and when it is high, the CPU selects I/O address space.

This line is high impedance during hold acknowledge.

WR

WRITE: Output

This line indicates that the CPU is in a memory or I/O write cycle.

This line is a write strobe signal when the CPU writes data to memory or an I/O device.

This line is active low.

This line is high impedance during hold acknowledge.

INTA

INTERRUPT ACKNOWLEDGE: Output

This line is a read strobe signal for the interrupt acknowledge cycle.

This line is active low.

ALE

ADDRESS LATCH ENABLE: Output

This line is used for latching an address into the MSM82C12 address latch it is a positive pulse and the trailing edge is used to strobe the address. This line is never floated.

DT/R

DATA TRANSMIT/RECEIVE: Output

This line is used to control the direction of the bus transceiver.

When this line is high, the CPU transmits data, and when it is low, the CPU receive data.

This line is high impedance during hold acknowledge.

DEN

DATA ENABLE: Output

This line is used to control the output enable of the bus transceiver.

This line is active low. This line is high impedance during hold acknowledge.

HOLD

HOLD REQUEST: Input

This line is used for a Bus Request from an other device.

This line is active high.

HLDA

HOLD ACKNOWLEDGE: Output

This line is used for a Bus Grant to an other device.

This line is active high.

SS0

STATUS: Output

This line is logically equivalent to S0 in the maximum mode.

STATIC OPERATION

All MSM80C88A circuitry is of static design. Internal registers, counters and latches are static and require no refresh as with dynamic circuit design. This eliminates the minimum operating frequency restriction placed on other microprocessors. The MSM80C88A can operate from DC to the appropriate upper frequency limit. The processor clock may be stopped in either state (high/low) and held there indefinitely. This type of operation is especially useful for system debug or power critical applications.

The MSM80C88A can be signal stepped using only the CPU clock. This state can be maintained as long as is necessary. Single step clock operation allows simple interface circuitry to provide critical information for bringing up your system.

Static design also allows very low frequency operation (down to DC). In a power critical situation, this can provide extremely low power operation since 80C88A power dissipation is directly related to operating frequency. As the system frequency is reduced, so is the operating power until, ultimately, at a DC input frequency, the MSM80C88A power requirement is the standby current (500 μ A maximum).

FUNCTIONAL DESCRIPTION

GENERAL OPERATION

The internal function of the MSM80C88A consist of a Bus Interface Unit (BIU) and an Execution Unit (EU). These units operate mutually but perform as separate processors.

The BIU performs instruction fetch and queueing, operand fetch, DATA read and write address relocation and basic bus control. By performing instruction pre-fetch while waiting for decoding and execution of instruction, the CPU's performance is increased. Up to 4-bytes of instruction stream can be queued.

EU receives pre-fetched instructions from the BIU queue, decodes and executes instructions and provides an un-relocated operand address to the BIU.

MEMORY ORGANIZATION

The MSM80C88A has a 20-bit address to memory. Each address has 8-bit data width. Memory is organized 00000H to FFFFFH and is logically divided into four segments: code, data, extra data and stack segment. Each segment contains up to 64 Kbytes and locates on a 16-byte boundary. (Fig. 3a)

All memory references are made relative to a segment register according to a select rule. Memory location FFFF0H is the start address after reset, and 00000H through 003FFH are reserved as an interrupt pointer. There are 256 types of interrupt pointer;

Each interrupt type has a 4-byte pointer element consisting of a 16-bit segment address and a 16-bit offset address.

Memory Organization

Reserved Memory Locations

Memory Reference Need	Segment Register Used	Segment Selection Rule
Instructions	CODE (CS)	Automatic with all instruction prefetch.
Stack	STACK (SS)	All stack pushes and pops. Memory references relative to BP base register except data references.
Local Data	DATA (DS)	Data references when relative to stack, destination of string operation, or explicitly overridden.
External (Global) Data	EXTRA (ES)	Destination of string operations: Explicitly selected using a segment override.

MINIMUM AND MAXIMUM MODES

The MSM80C88A has two system modes: minimum and maximum. When using the maximum mode, it is easy to organize a multiple-CPU system with the MSM 82C88 Bus Controller which generates the bus control signal.

When using the minimum mode, it is easy to organize a simple system by generating the bus control signal itself. MN/MX is the mode select pin. Definition of 24–31, 34 pin changes depends on the MN/MX pin.

BUS OPERATION

The MSM80C88A has a time multiplexed address and data bus. If a non-multiplexed bus is desired for the system, it is only needed to add the address latch.

A CPU bus cycle consists of at least four clock cycles: T1, T2, T3 and T4. (Fig. 4)

The address output occurs during T1, and data transfer occurs during T3 and T4. T2 is used for changing the direction of the bus during read operation. When the device which is accessed by the CPU is not ready to data transfer and send to the CPU "NOT READY" is indicated TW cycles are inserted between T3 and T4.

When a bus cycle is not needed, T1 cycles are inserted between the bus cycles for internal execution. At the T1 cycle an ALE signal is output from the CPU or the MSM82C88 depending in MN/MX. at the trailing edge of an ALE, a valid address may be latched. Status bits S0, S1 and S2 are used, in maximum mode, by the bus controller to recognize the type of bus operation according to the following table.

S2	S1	S0	Characteristics
0 (LOW)	0	0	Interrupt acknowledge
0	0	1	Read I/O
0	1	0	Write I/O
0	1	1	Halt
1 (HIGH)	0	0	Instruction Fetch
1	0	1	Read Data from Memory
1	1	0	Write Data to Memory
1	1	1	Passive (no bus cycle)

Status bit S3 through S6 are multiplexed with A16–A19, and therefore they are valid during T2 through T4. S3 and S4 indicate which segment register was selected on the bus cycle, according to the following table.

S4	S3	Characteristics
0 (LOW)	0	Alternate Data (Extra Segment)
0	1	Stack
1 (HIGH)	0	Code or None
1	1	Data

S5 indicates interrupt enable Flag.

I/O ADDRESSING

The MSM80C88A has a 64 Kbyte I/O. When the CPU accesses an I/O device, address A0–A15 are in same format as a memory access, and A16–A19 are low.

I/O ports address are same as four memory.

Basic System Timing

EXTERNAL INTERFACE

RESET

CPU initialization is executed by the RESET pin. The MSM80C88A's RESET High signal is required for greater than 4 clock cycles.

The rising edge of RESET terminates the present operation immediately. The falling edge of RESET triggers an internal reset sequence for approximately 10 clock cycles. After internal reset sequence is finished, normal operation begins from absolute location FFFF0H.

INTERRUPT OPERATIONS

The interrupt operation is classified as software or hardware, and hardware interrupt is classified as non-maskable or maskable.

An interrupt causes a new program location which is defined by the interrupt pointer table, according to the interrupt type. Absolute location 00000H through 003FFH is reserved for the interrupt pointer table. The interrupt pointer table consists of 256 elements. Each element is 4 bytes in size and corresponds to an 8-bit type number which is sent from an interrupt request device during the interrupt acknowledge cycle.

NON-MASKABLE INTERRUPT (NMI)

The MSM80C88A has a non-maskable Interrupt (NMI) which is of higher priority than a maskable interrupt request (INTR).

An NMI request pulse width needs minimum of 2 clock cycles. The NMI will be serviced at the end of the current instruction or between string manipulations.

MASKABLE INTERRUPT (INTR)

The MSM80C88A provides another interrupt request (INTR) which can be masked by software. INTR is level triggered, so it must be held until interrupt request is acknowledged.

The INTR will be serviced at the end of the current instruction or between string manipulations.

INTERRUPT ACKNOWLEDGE

During the interrupt acknowledge sequence, further interrupts are disabled. The interrupt enable bit is reset by any interrupt, after which the Flag register is automatically pushed onto the stack. During an acknowledge sequence, the CPU emits the lock signal from T2 of first bus cycle to T2 of second bus cycle. At the second bus cycle, a byte is fetched from the external device as a vector which identifies the type of interrupt. This vector is multiplied by four and used as an interrupt pointer address (INTR only).

The Interrupt Return (IRET) instruction includes a Flag pop operation which returns the original interrupt enable bit when it restores the Flag.

HALT

When a Halt instruction is executed, the CPU enter Halt state. An interrupt request or RESET will force the MSM80C88A out of the Halt state.

SYSTEM TIMING—MINIMUM MODE

A bus cycle begins at T1 with an ALE signal. The trailing edge of ALE is used to latch the address. From T1 to T4 the IO/M signal indicates a memory or I/O operation. From T2 to T4, the address data bus changes the address bus to the data bus.

The read (RD), write (WR), and interrupt acknowledge (INTA) signals caused the addressed device to enable the data bus. These signals become active at the beginning of T2 and inactive at the beginning of T4.

SYSTEM TIMING—MAXIMUM MODE

In maximum mode, the MSM82C88 Bus Controller is added to system. The CPU sends status information to the Bus Controller. Bus timing signals are generated by the Bus Controller. Bus timing is almost the same as in minimum mode.

Interrupt Acknowledge Sequence

BUS HOLD CIRCUITRY

To avoid high current conditions caused by floating inputs to CMOS devices, and to eliminate the need for pull-up/down resistors, "bus-hold" circuitry has been used on 80C86 pins 2-16, 26-32, and 34-39 (Figures 6a, 6b). These circuits will maintain the last valid logic state if no driving source is present (i.e. an unconnected pin or a driving source which goes to a high impedance state). To overdrive the "bus

hold" circuits, an external driver must be capable of supplying approximately 400 μ A minimum sink or source current at valid input voltage levels. Since this "bus hold" circuitry is active and not a "resistive" type element, the associated power supply current is negligible and power dissipation is significantly reduced when compared to the use of passive pull-up resistors.

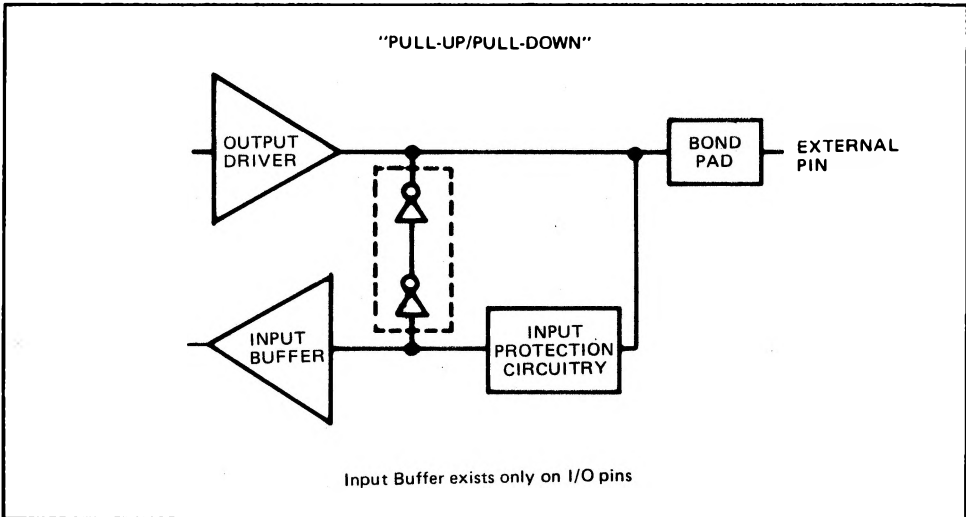

Figure 6a. Bus hold circuitry pin 2-16, 35-39.

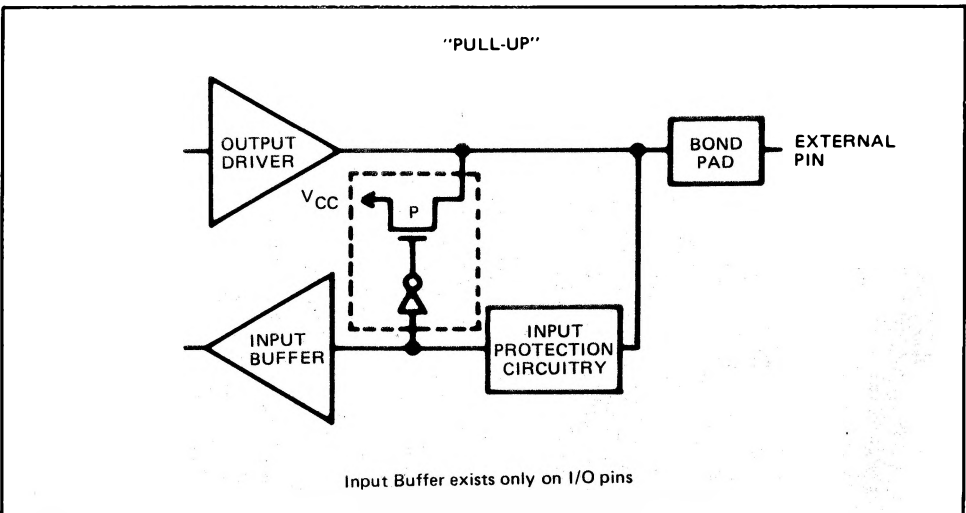

Figure 6b. Bus hold circuitry pin 26-32, 34

Footnotes:

AL = 8-bit accumulator

AX = 18-bit accumulator

CX = Count register

DS = Data segment

ES = Extra segment

Above/below refers to unsigned value

Greater = more positive

Less = less positive (more negative) signed value

If d = 1 then "to" reg: If d = 0 then "from" reg.

If w = 1 then word instruction: If w = 0 then byte instruction

If mod = 11 then r/m is treated as a REG field

If mod = 00 then DISP = 0*, disp-low and disp-high are absent

If mod = 01 then DISP = disp-low sign-extended to 16-bits, disp-high is absent

If mod = 10 then DISP = disp-high: disp-low

If r/m = 000 then EA = (BX) + (SI) + DISP

If r/m = 001 then EA = (BX) + (DI) + DISP

If r/m = 010 then EA = (BP) + (SI) + DISP

If r/m = 011 then EA = (BP) + (DI) + DISP

If r/m = 100 then EA = (SI) + DISP

If r/m = 101 then EA = (DI) + DISP

If r/m = 110 then EA = (BP) + DISP*

If r/m = 111 then EA = (BX) + DISP

DISP follows 2nd byte of instruction (before data if required)

* except if mod = 00 and r/m = 110 then EA-disp-high: disp-low

If s:w = 01 then 16 bits of immediate data form the operand

If s:w = 11 then an immediate data byte is sign extended to form the 16-bit operand

If v = 0 then "count" = 1: If v = 1 then "count" in (CL)

x = don't care

z is used for string primitives for comparison with ZF FLAG

SEGMENT OVERRIDE PREFIX

001 reg 110

REG is assigned according to the following table:

16-Bit (w = 1)	8-Bit (w = 0)	Segment
000 AX	000 AL	00 ES
001 CX	001 CL	01 CS
010 DX	010 DL	10 SS
011 BX	011 BL	11 DS
100 SP	100 AH	
101 BP	101 CH	
110 SI	110 DH	
111 DI	111 BH	

Instructions which reference the flag register file as a 16-bit object use the symbol FLAGS to represent the file:

FLAGS = x:x:x:x:(OF):(DF):(IF):(TF):(SF):(ZF):X:(AF):X:(PF):X:(CF)
