● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

2	DRV	Current driver This terminal can be used for current driver, because it is synchronized with mode switch. In case that this circuit isn't used, this terminal should be connected with SW _{B2} (Pin⑤) terminal, as a result low voltage operation is improved.

APPLICATION NOTE

1. MODE EXPLANATION

IC MODE		V _O SW		MODE SW	CURRENT DRIVER Pin②
		SW _{1A}	SW _{1B}	SW ₂	
V _O = 2.5V	Power Supply Mode	GND	Short	V _{CC}	ON
	Back Up Mode			Open / GND	OFF
V _O = 5V	Power Supply Mode	Open	Open	V _{CC}	ON
	Back Up Mode			Open / GND	OFF

2. OPERATION OF BACK UP MODE

In case of back up mode, this IC is operated by blocking oscillation. This operation is described as follows.

- (1) When potential of output V_O reaches V_{TH(L)}, the V_O control circuit in the IC starts the converter circuit.
 - (2) When the converter is started, the capacitor C connected with V_O terminal is charged and when V_O reaches V_{TH(H)}, the converter is stopped.
 - (3) The charge of the capacitor C is consumed gradually by load current and comes close to V_{TH(L)}. This IC performs the blocking oscillation by repeating (1)~(3) above.
- The frequency of this blocking oscillation depends on load current and a capacitor connected with V_O terminal.

3. MODE SW

It is necessary to connect an external pull-down resistor with the terminal of MODE SW (pin①), in case that this IC operates in power supply mode due to external noise etc, even though this IC is back up mode.

4. CURRENT DRIVER TERMINAL

In case that current driver terminal (pin②) isn't used, this terminal should be connected with SW_{B2} terminal (pin⑤), as a result low voltage operation is improved. When this terminal is kept open, there is a probability that the MODE SW circuit doesn't operate normally.

5. RADIATION

It is necessary to connect a L/C or R/C filter, in case that output noise is large due to radiation etc. Because this IC has adopted a converter circuit of flyback system.

6. V_O and V_{CC}

Supply voltage should not be high than output voltage, because this IC is boost type DC/DC converter.
