Audio FM processor for VHS hi-fi audio

TDA9610H

FEATURES

- Integrated High Frequency (HF) low-pass filter (LPF) and summator
- Low-noise Phase-Locked Loop (PLL) FM (de)modulator
- Low-distortion sample-and-hold switching noise suppressor
- Integrated audio low-pass filter
- 4 stereo input selectors (left [L] and right [R] channel):
 - EXT1L and EXT1R
 - EXT2L and EXT2R
 - CINL and CINR
 - TUNL and TUNR
- Additional mono inputs for linear audio: EXN1 and EXN2
- DC output for VU meter drive
- Direct headphone drive
- Linear input/linear output
- Modulator output with overload Automatic Gain Control (AGC)
- RAF (Record Audio FM) for head amplifier control
- Power-down mode facility
- I²C-bus control of:
 - line input volume
 - headphone output volume
 - input/output selector
 - PAL/NTSC mode
- E-E performance (record + playback):
 - Total Harmonic Distortion (THD): 0.05% (–8 dBV, 1 kHz)
 - linearity error: 0.1 dB (–88 dBV)
 - noise: –93 dBV (20 Hz to 20 kHz).

GENERAL DESCRIPTION

The TDA9610H is a dual audio FM processing IC for VHS hi-fi audio, digitally controlled via the I²C-bus. The FM (de)modulator and peak noise reduction functions are highly integrated, resulting in few external components and adjustments.

In addition special functions for audio editing, mixing and dubbing have been implemented.

ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
TDA9610H	QFP64 ⁽¹⁾	plastic quad flat package; 64 leads (lead length 1.95 mm); body 14 × 20 × 2.8 mm	SOT319-2

Note

1. When using IR reflow soldering it is recommended that the Drypack instructions in the "Quality Reference Handbook" (order number 9398 510 63011) are followed.

PINNING

SYMBOL	PIN	DESCRIPTION
AFINL	1	audio input for either audio clipper (record) or noise reduction (playback) of left channel
AFOUTL	2	audio output from either sample-and-hold (playback) or noise reduction (record and loop-through) of left channel
EXT2L	3	input selector for left channel
EXT2R	4	input selector for right channel
EXT1L	5	input selector for left channel
EXT1R	6	input selector for right channel
CINL	7	input selector for left channel
CINR	8	input selector for right channel
TUNL	9	input selector for left channel
TUNR	10	input selector for right channel
ENVOUT	11	level detector output; external capacitor required for filtering
MUTE	12	mute timing; external capacitor required for timing playback mute
V _{DDD}	13	digital supply voltage (+5 V)
RAF	14	override the I ² C-bit RAF input or record/playback switch drive output for head amplifier control
V _{SSD}	15	I ² C-bus digital ground
SDA	16	I ² C-bus data input
SCL	17	I ² C-bus clock input
XS	18	auxiliary switch; digital output controlled by I ² C-bit XS
V _{DDA1}	19	analog supply voltage 1 (+12 V)
V _{DDH}	20	headphone supply voltage (+12 V)
V _{SSH}	21	headphone ground
HPOUTL	22	headphone drive output left
HPOUTR	23	headphone drive output right
RVAR	24	gain adjustment of noise reduction by means of a resistor to ground
RFIX	25	fixed bias current generation circuit by using an external 100 k Ω resistor to ground
i.c.	26	pin internally connected to die pad; preferably connected to ground
LINEL	27	line output left
LINER	28	line output right
MODAGC	29	RF modulator AGC-time constant
MODOUT	30	RF modulator drive output
DCOUTL	31	VU meter drive output left
DCOUTR	32	VU meter drive output right
LININ	33	linear input
n.c.	34	not connected
DCFBL	35	DC feedback left
DCREFL	36	DC reference left
EMPHL	37	total emphasis left (20 to 240 μ s)

Audio FM processor for VHS hi-fi audio

TDA9610H

SYMBOL	PIN	DESCRIPTION
RECTL	38	rectifier DC decoupling left
DETL	39	attack/recovery timing left
V _{ref}	40	noise filtering of 3.8 V reference voltage; external capacitor required for filtering
V _{SSA1}	41	analog ground for LF circuits
DETR	42	attack/recovery timing right
RECTR	43	rectifier DC decoupling right
EMPHR	44	total emphasis right (20 to 240 μs)
DCREFR	45	DC reference right
DCFBR	46	DC feedback left
LINOUT	47	linear output
EXN1	48	EXN input (external normal input); mono input selectable to linear output
AFOUTR	49	audio output from either sample-and-hold (playback) or noise reduction (record and loop-through) of right channel
AFINR	50	audio input for either audio clipper (record) or noise reduction (playback) of right channel
HID	51	head identification pulse input for sample-and-hold circuits
EXN2	52	EXN input (external normal input); mono input selectable to linear output
FADJR	53	frequency adjustment of right channel oscillator by means of a variable resistor
n.c.	54	not connected; preferably connected to ground
FMINR	55	1.7 to 1.8 MHz input for limiter
FMOUT	56	FM output
V _{DDA2}	57	analog supply voltage (+5 V)
i.c.	58	pin internally connected to die pad; preferably connected to ground
V _{SSA2}	59	analog ground for HF circuits
NTSC	60	digital output controlled by I ² C-bit NTSC
FMINL	61	1.3 to 1.4 MHz input for limiter
n.c.	62	not connected; preferably connected to ground
n.c.	63	not connected; preferably connected to ground
FADJL	64	frequency adjustment of left channel oscillator by means of a variable resistor

Audio FM processor for VHS hi-fi audio

TDA9610H

FUNCTIONAL DESCRIPTION

The IC is intended for use within the audio FM system of VHS video recorders. Three modes of operation can be distinguished:

- Record mode
- Playback mode
- Loop-through mode.

Switching and control of the three modes is done by the I²C-bus.

Record mode

The audio signal, selected from the four stereo audio inputs (EXT1L, EXT1R, EXT2L, EXT2R, CINL, CINR, TUNL and TUNR), is fed to the volume control stage (separate for left [L] and right [R]). The information for LINOUT is, after summing of L and R, derived from either one of the four stereo inputs or the volume control output or one of the mono inputs (EXN1 and EXN2). After the Low-Pass Filter (LPF) and signal compression in the noise reduction (NR) and filter block the audio signal is available at AFOUTL and AFOUTR. The compressed signal is now FM modulated on a RF carrier in the PLL block. After low-pass filtering and summation of both RF carriers (L and R) the signal is available at FMOUT.

The output select block offers the possibility to choose eight different audio signal modes:

1. Stereo.
2. Left.
3. Right.
4. Mono.
5. Normal.
6. Mixed stereo (stereo + LININ).
7. Mixed left (left + LININ).
8. Mixed right (right + LININ).

These audio signal modes are selectable for the output stages LINEL, LINER and MODOUT. The standard audio output is LINEL and LINER, e.g. for SCART output.

MODOUT is a mono audio output, with an overload-protecting AGC, to drive an external RF modulator.

The headphone select block offers the possibility to choose either the output select signal or four independent audio signal modes (stereo, left, right and normal) for the output stages HPOUTL and HPOUTR.

HPOUTL and HPOUTR, with common volume control for L and R, is suitable for direct headphone drive.

DCOUTL and DCOUTR are intended for VU meter drive. It is connected to the selected stereo audio input after the volume control block. The output signal at DCOUTL and DCOUTR is proportional to the square root of the recorded audio signal (see Fig.3).

Playback mode

The two FM modulated RF carriers, present at the two FMINL and FMINR inputs after being band-pass filtered, are demodulated in the PLL block. The LF audio signal is fed through a sample-and-hold circuit to suppress head-switching noise. The demodulated audio signal is available at AFOUTL and AFOUTR. The audio signal is low-pass filtered and expanded in the noise reduction (NR) and filter block. The resulting audio signal is available after the output and headphone select blocks for all four output stages (LINEL, LINER, MODOUT, HPOUTL, HPOUTR, DCOUTL and DCOUTR). The functionality of the output and headphone select blocks is identical to the record mode. During playback DCOUTL and DCOUTR are connected to the headphone select block.

The functionality of the input and normal select blocks is also identical to record mode (see Fig.3), which offers the possibility to control (other) audio signals independently for LINOUT (see Fig.4).

Loop-through mode

This mode is similar to the record mode (see Fig.3), except for the FMOUT pin, which is inactive, and the RAF output which is active LOW (see Fig.5).

6. See Section "Headphone volume byte".

Audio FM processor for VHS hi-fi audio

TDA9610H

Control byte**Table 3** Bits of control byte

BIT	DESCRIPTION
IPAF	Inverse Playback Audio FM; see Table 4
RAF	Record Audio FM; see Table 4
NTSC	National Television Standards Committee; television standard; see Table 5
PAFM	Playback Audio FM Mute; see Table 6
MUTE	Mute; see Table 7

Table 4 Bits IPAF and RAF

IPAF	RAF ⁽¹⁾	MODE	DESCRIPTION
0	0	playback	NR and modem in playback mode
1	0	loop-through	NR in record mode; modem not active [por]
0	1	record ⁽²⁾	NR and modem in record mode
1	1	record ⁽²⁾	NR and modem in record mode

Notes

1. The RAF bit can be overruled externally by applying a low-ohmic voltage to the RAF I/O (pin 14) either logic 0 or logic 1 (0 or +5 V). The actual mode of the IC is determined by the level measured at this pin.
2. The two record modes are equal, only differing in their reaction to forcing RAF LOW at the RAF I/O pin; the status of the IPAF bit determines whether the IC is switched to the playback or loop-through mode.

Table 5 Bit NTSC

NTSC	MODE	DESCRIPTION
0	PAL	modem set to PAL carrier frequencies [por]
1	NTSC	modem set to NTSC carrier frequencies

Table 6 Bit PAFM

PAFM ⁽¹⁾	MODE	DESCRIPTION
0	–	
1	PB mute	the signal from the modem is muted in playback mode

Note

1. Bit PAFM has the same effect as the internally generated mute signal from the modem part when no FM carrier is detected during playback mode. If one (or both) of these signals is HIGH, the audio signal coming from the modem is muted.

Table 7 Bit MUTE

MUTE	MODE	DESCRIPTION
0	–	
1	full mute	all audio outputs are muted [por]

Audio FM processor for VHS hi-fi audio

TDA9610H

Select byte**Table 8** Bits of select byte

BIT	DESCRIPTION
SAOL	Select Audio Output Left; see Table 9
SAOR	Select Audio Output Right; see Table 9
SAON	Select Audio Output Normal; see Table 9
HSF	Headphone Select Function; see Table 10
NSS	Normal Special Select; see Table 11

Table 9 Bits SAOL, SAOR and SAON; note 1

SAOL	SAOR	SAON	MODE	DESCRIPTION
1	1	0	stereo	left at LINEL, right at LINER [por]
1	0	0	left	left at both LINEL and LINER
0	1	0	right	right at both LINEL and LINER
0	0	0	mono	left + right added at both LINEL and LINER (hi-fi mono)
1	1	1	mixed stereo	left + normal added at LINEL, right + normal added at LINER
1	0	1	mixed left	left + normal added at both LINEL and LINER
0	1	1	mixed right	right + normal added at both LINEL and LINER
0	0	1	normal	normal (is linear audio) at both LINEL and LINER

Note

- The bits SAOL, SAOR and SAON provide eight output select functions, left and right are the left and right hi-fi channels, normal is the conventional audio channel, linear audio input (LININ; pin 33).

Table 10 Bit HSF; note 1

HSF	MODE	DESCRIPTION
0	–	headphone output signals identical to line outputs LINEL and LINER [por]
1	headphone select	headphone output signals independently selectable

Note

- Normally the headphone outputs carry the same audio signal as present at the line outputs (LINEL and LINER), so the signal is selectable by means of the bits SAOL, SAOR and SAON. However when bit HSF is set HIGH, the headphone output has its own output select function switchable with bits HSL and HSR to stereo, left, right and normal (see Section "Function byte").

Table 11 Bit NSS; note 1

NSS	MODE	DESCRIPTION
0	–	signal at LINOUT is the mono version of selected stereo line input pair [por]
1	normal special select	special output signals selectable for LINOUT

Note

- Normally the bits NSH and NSL select one of the four possible stereo line inputs (TUNL/R, CINL/R, EXT1L/R, EXT2L/R) as the source signal for linear out. Left and right channels of the selected input are added to give a mono signal as output.
When bit NSS is set HIGH, four special input selects can be made in combination with the same bits NSH and NSL; volume controlled, tuner left (TUNL), EXN1 and EXN2 (see Section "Input byte").

Audio FM processor for VHS hi-fi audio

TDA9610H

Input byte

Table 12 Bits of input byte

BIT	DESCRIPTION
ISH	Input Select HIGH; see Table 13
ISL	Input Select LOW; see Table 13
NSH	Normal Select HIGH; see Table 14
NSL	Normal Select LOW; see Table 14

Table 13 Bits ISH and ISL; note 1

ISH	ISL	MODE	DESCRIPTION
0	0	Tuner	TUNL and TUNR selected (as hi-fi stereo input source) [por]
0	1	Cinch	CINL and CINR selected
1	0	Ext1	EXT1L and EXT1R (e.g. Scart input) selected
1	1	Ext2	EXT2L and EXT2R selected

Note

1. With bits ISH and ISL the stereo input signal is selected which is fed to the hi-fi processing. One out of four stereo sources can be selected. The terms: Tuner, Cinch, Ext1 and Ext2 are used for describing purposes only, technically all four inputs are equal (except for the fact that tuner left (TUNL, pin 6) is also selectable by Normal Select).

Table 14 Bits NSH, NSL and NSS; note 1

NSH	NSL	NSS ⁽²⁾	MODE	DESCRIPTION
0	0	0	Tuner	TUNL and TUNR selected (as normal audio input source) [por]
0	1	0	Cinch	CINL and CINR selected
1	0	0	Ext1	EXT1L and EXT1R selected
1	1	0	Ext2	EXT2L and EXT2R selected
0	0	1	Volume	hi-fi input source selected; taken after record volume control
0	1	1	Exn1	additional mono input (EXN1, pin 48) selected
1	0	1	Tuner left	only TUNL selected (e.g. dual language)
1	1	1	Exn2	additional mono input (EXN2, pin 52) selected

Notes

1. With bits NSH and NSL in combination with bit NSS the input signal is selected which is fed out at pin 47 (LINOUT). With bit NSS set LOW a selection can be made between the four stereo line inputs (like the hi-fi input select). With bit NSS set HIGH, bits NSH and NSL make a selection between four special select functions.

When a stereo input source is selected, both channels are added to obtain a mono output signal, then the output signal at LINOUT is equal to: $\frac{(L + R)}{2}$

In the Volume mode the output signal is equal to: $\frac{(L \times \text{Volume Left} + R \times \text{Volume Right})}{2}$

Note that for the Volume mode the hi-fi input select (ISH and ISL) determines the used input source.

2. NSS from select byte.

Audio FM processor for VHS hi-fi audio

TDA9610H

Function byte**Table 15** Bits of function byte

BIT	DESCRIPTION
HSL	Headphone Select Left; see Table 16
HSR	Headphone Select Right; see Table 16
XS	auxiliary Switch; see Table 17
TEST	Test; see Table 18

Table 16 Bits HSL, HSR and HSF; note 1

HSL	HSR	HSF ⁽²⁾	MODE	DESCRIPTION
1	1	0	outsel	headphone output signal identical to LINEL and LINER
1	0	0	outsel	headphone output signal identical to LINEL and LINER
0	1	0	outsel	headphone output signal identical to LINEL and LINER
0	0	0	outsel	headphone output signal identical to LINEL and LINER [por]
1	1	1	stereo	left at HPOUTL, right at HPOUTR
1	0	1	left	left at both HPOUTL and HPOUTR
0	1	1	right	right at both HPOUTL and HPOUTR
0	0	1	normal	normal (is linear audio) at both HPOUTL and HPOUTR

Notes

1. Normally (bit HSF set LOW) the headphone outputs carry the same audio signal as present at the line outputs (LINEL and LINER), so the signal is selectable by means of the bits SAOL, SAOR and SAON. However, when bit HSF is set HIGH the headphone output has its own output select function switchable with bits HSL and HSR.

a) These special headphone selections are also active for the VU meter drive during playback.

2. HSF from select byte.

Note

1. This is the situation after Power-On Reset (POR).

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
V_{DDA1}	analog supply voltage	0	13.2	V
V_{DDA2}	analog supply voltage	0	5.5	V
V_{DDH}	headphone supply voltage	0	13.2	V
V_{DDD}	digital supply voltage	0	5.5	V
V_n	voltage on pins: 1, 3, 4, 5, 6, 7, 8, 9, 10, 39, 42, 48, 50 and 52 11, 12, 56 and 60 14 and 18	0 0 0	7.7 V_{DDA2} V_{DDD}	V V V
T_{stg}	storage temperature	-65	+150	°C
T_{amb}	operating ambient temperature	0	+70	°C

HANDLING

All pins are meeting the ESD requirements.

Remark: Pin 1 showed a higher sensitivity during the latch-up test and was not fully meeting the test limits.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th\ j-a}$	thermal resistance from junction to ambient in free air	55	K/W

Audio FM processor for VHS hi-fi audio

TDA9610H

DC CHARACTERISTICS

$V_{DDA1} = 12\text{ V}$; $V_{DDA2} = 5\text{ V}$; $f_{OUTR} = 1.8\text{ MHz}$; $f_{OUTL} = 1.4\text{ MHz}$; NTSC = 0; $f_m = 1\text{ kHz}$; $T_{amb} = 25\text{ °C}$; all volume control levels set to 0 dB; measured in test circuit (see Fig.12); unless otherwise specified.

		$f_i = 10$ kHz	-9.7	-7.7	-5.7	dB
DC outputs (DCOUTL and DCOUTR; pins 31 and 32); square root of output voltage (see Fig.8)						
V_{oz}	output voltage for zero input level	HSF = 1	–	–	300	mV
		HSF = 0	–	–	440	mV

Note

- The audio distortion is measured with the HID pulse frequency set to 1 kHz (500 Hz input at pin 51). FM signal: $f_m = 10$ kHz; $\Delta f = 50$ kHz. The distortion is measured with a 3 kHz 4th-order low-pass filter. The measured value at 1 kHz HID-pulse frequency is corrected with 26 dB in order to calculate the equivalent distortion at 50 Hz HID-pulse frequency.

TEST AND APPLICATION INFORMATION

Fig.12 Test circuit.

Audio FM processor for VHS hi-fi audio

TDA9610H

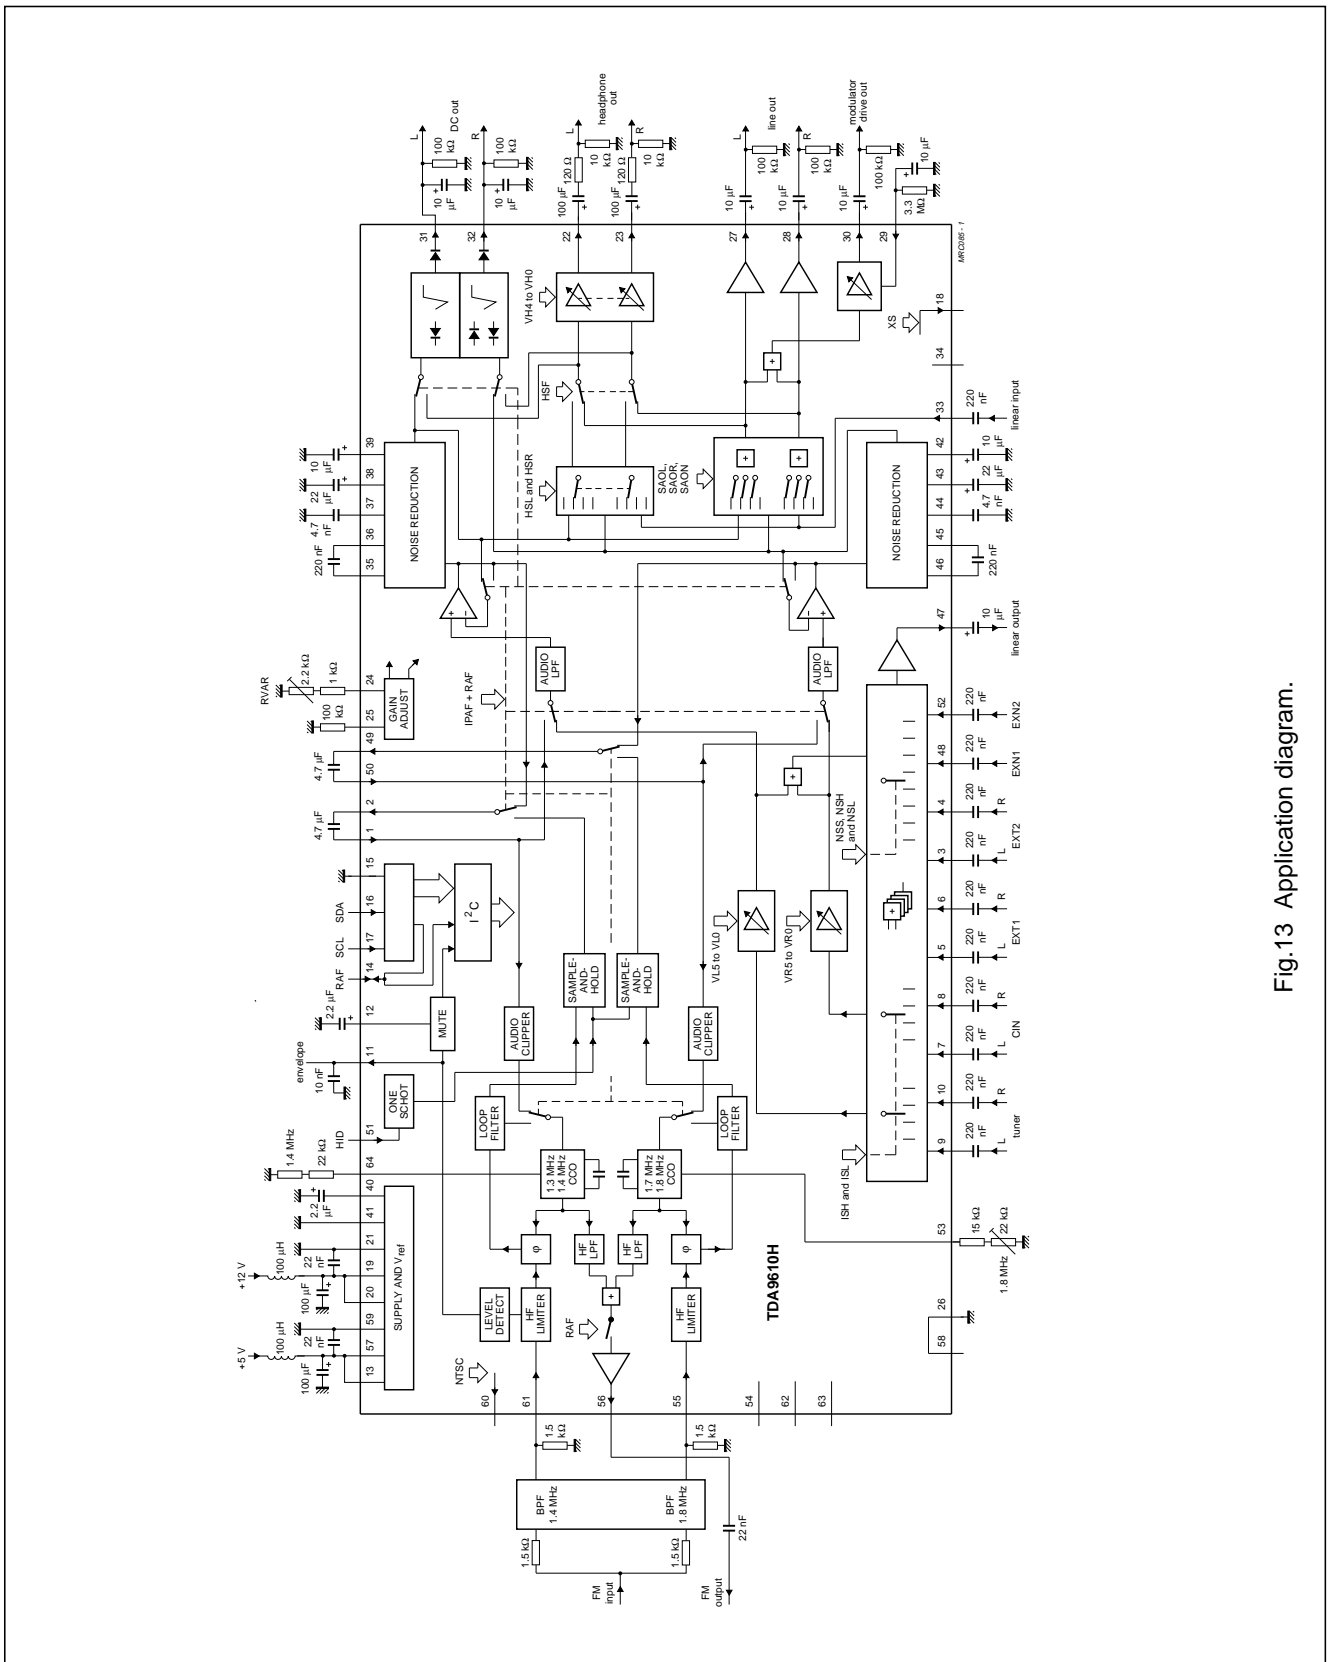

Fig.13 Application diagram.

Audio FM processor for VHS hi-fi audio

TDA9610H

Adjustment of VCO frequency

Set the TDA9610H in record mode (NTSC off), no audio input signal.

Measure the frequency at FMOUT (pin 56) with a frequency counter and use the VCO TEST modes (see Section "Function byte") to output only the channel of interest.

Adjust the VCO frequencies to 1.4 MHz \pm 10 kHz and 1.8 MHz \pm 10 kHz by means of the potentiometers at pin 64 (FADJL) and pin 53 (FADJR).

When NTSC is to be the main video standard, set NTSC on and adjust to 1.3 MHz and 1.7 MHz for optimum frequency accuracy.

Standard FM deviation and audio level

Reference levels of frequency deviation and audio output level are set by the resistor value at pin 24 (RVAR); simultaneous for left, right, playback and record. Typical resistor values can be calculated with equation:

$$R_{\text{typ}} = \frac{\left(\frac{\Delta f}{50 \text{ kHz}}\right)^2}{\left(\frac{A}{400 \text{ mV (RMS)}}\right)} \times 2.2 \text{ k}\Omega$$

Where:

Δf = reference FM deviation.

A = reference audio output level (1 kHz audio frequency).

If adjustment for overall tolerance is needed, R has to be made adjustable for the range $0.7R_{\text{typ}}$ to $1.4R_{\text{typ}}$.

Set the TDA9610H in playback. Use a HF test generator to make a carrier of 1.4 MHz with the desired modulation and input this signal at FMINL (pin 61) or before the band-pass filter and measure the audio output level at LINEL (pin 27).

Power-down mode

To lower the dissipation in a stand-by situation, the 12 V supply voltage at pin 19 (V_{DDA1}) and pin 20 (V_{DDH}) may be switched off, with pins 19 and 20 'floating'. No low-ohmic DC path to ground may be seen from pins 19 and 20, because this will drain extra current from the 5 V supply via these pins to ground.

Because of the fact that the I²C circuitry and the digital outputs RAF, NTSC and XS are supplied via the 5 V supply, no I²C settings will be lost and the output pins can still be used.

For instance, XS can be used to drive external mute transistors to mute the DC jump at the line outputs when switching the 12 V supply.

RAF I/O

The status of the I²C RAF bit is output at pin 14 (RAF = HIGH; record). This output can be used to switch the audio FM head amplifier to playback and record. If accurate fast switching of the TDA9610H is needed, this pin can also be used as input. Thereby overruling the I²C RAF bit. To make this possible the RAF output is current limited.

When using the RAF pin as output, no more than 35 μ A (LOW) and 185 μ A (HIGH) current may be drawn from this pin to assure the mode of the TDA9610H is not changed.

When using the RAF pin as input, the voltage source used must be capable of delivering at least 345 μ A (forced HIGH; >3.5 V) or sinking at least 65 μ A (forced LOW; <1.5 V).

Audio FM processor for VHS hi-fi audio

Audio FM processor for VHS hi-fi audio**TDA9610H**

SOLDERING**Plastic quad flat-packs**

BY WAVE

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 s, if allowed to cool to less than 150 °C within 6 s. Typical dwell time is 4 s at 250 °C.

A modified wave soldering technique is recommended using two solder waves (dual-wave), in which a turbulent wave with high upward pressure is followed by a smooth laminar wave. Using a mildly-activated flux eliminates the need for removal of corrosive residues in most applications.

BY SOLDER PASTE REFLOW

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be

applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 s according to method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 min at 45 °C.

REPAIRING SOLDERED JOINTS (BY HAND-HELD SOLDERING IRON OR PULSE-HEATED SOLDER TOOL)

Fix the component by first soldering two, diagonally opposite, end pins. Apply the heating tool to the flat part of the pin only. Contact time must be limited to 10 s at up to 300 °C. When using proper tools, all other pins can be soldered in one operation within 2 to 5 s at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages.)

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to the substrate by dipping or by an extra thick tin/lead plating before package placement.

TDA9610H

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
